IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF GEORGIA
ATLANTA DIVISION

Civil Action No. 1:18-cv-05391-SCJ

FAIR FIGHT ACTION, INC., et al.,
Plaintiff

vs.

BRAD RAFFENSPERGER, in his Official Capacity as Secretary of State of Georgia, et al.,
Defendants

DEPOSITION OF STEPHEN C. GRAVES, Ph.D., a witness called on behalf of the Defendants, pursuant to the Federal Rules of Civil Procedure, before Kelly G. Rae, a Notary Public in and for the Commonwealth of Massachusetts, at the Massachusetts Institute of Technology, MIT Sloan Building, 100 Main Street, Fifth Floor, Cambridge, Massachusetts, on Tuesday, February 25, 2020, commencing at 10:22 a.m.

APPEARANCES:

DuBOSE MILLER LLC
(by Von A. DuBose, Esquire)
75 14th Street N.E., Suite 2110
Atlanta, Georgia 30309
dubose@dubosemiller.com
for the Plaintiff;

ROBBINS ROSS ALLOY BELINFANTE LITTLEFIELD LLC
(by Josh B. Belinfante, Esquire)
500 14th Street, N.W.
Atlanta, Georgia 30318
Jbelinfante@robbinsfirm.com
for the Defendants.

I N D E X

E X H I B I T S

STEPHEN C. GRAVES, Ph.D., a witness called for examination by counsel for the Defendants, having been satisfactorily identified by the production of her/his driver's license, being first sworn by the Notary Public, was examined and testified as follows:

DIRECT EXAMINATION

(By Mr. Belinfante)

Q. Morning, Doctor Graves. Do you prefer I call you Doctor Graves or Professor Graves?

A. Steve is fine.

Q. Steve? Okay. We met just a moment ago. I'm Josh Belinfante. I represent the State in this case and this is your deposition taken in the case of Verified Action, et al. versus Brad Raffensperger, et al.

MR. BELINFANTE: For purposes of discovery and all purposes under the Federal Rules of Civil Procedure, Von, do you want to reserve all objections except as going to form and privilege?

MR. DuBOSE: Yes.

MR. BELINFANTE: Great.

Q. Steve, have you had your deposition taken

before?
A. Yes, once before.
Q. So there's some general rules which you probably know. The most important is that I can't talk over you and I would ask that you not talk over me. Not because I'm going to get offended, it's just much easier for the court reporter.
If at any time you want to take a break, just let me know and we'll do that. The only thing I would ask is if I've asked a question, if you'd answer the question and then we can take a break after that answer. Is that agreeable?
A. Okay.
Q. There are going to be many times today that I will ask you to explain something maybe generally or whatnot. There's also probably going to be times that I ask you a question that to you makes no sense whatsoever. What I would ask is that if I do ask a question that's confusing in anyway just let me know and I'll try to rephrase it.
A. Okay.

Q. I think that covers the general rules.
Could you state and spell your name for the record?
A. Stephen Graves. S-t-e-p-h-e-n, Graves, G-r-a-v-e-s.
Q. Doctor Graves, what did you do to prepare for today's deposition, and I don't want to know of any communication or the content of any conversation you've had with your counsel or with plaintiff's counsel, I should say?
A. Main thing I did was I re-read the report I prepared, the expert report that came back, and then the response that I prepared for the expert report. I also re-read the 2018 Voting Experience, this bipartisan policy, and I just refreshed myself by looking through the spreadsheet that I used for most of the analysis that is reported here.
Q. Okay. You're compensated for this work at $300 an hour; is that correct?
A. Yes.
Q. Roughly how much time did you spend preparing your original expert report, do you know?

A. Yes. I know how much I got paid. So 16 hours.
Q. Were there multiple drafts of the report?
A. Not really. I prepared a draft and I think it got some grammatical edits but certainly not any substantive edits.
Q. Do you know when you turned in your first draft to plaintiff's counsel?
A. Not precisely. I could give you a rough estimate.
Q. That's fine.
A. I suspect it was early December. Maybe late November.
Q. Okay. Do you recall who contacted you about providing expert testimony in this litigation?
A. I'm pretty sure it was John Chandler.
Q. Did you know Mr. Chandler prior to his reaching out to you?
A. No.
Q. Did he, Mr. Chandler, ask you to make any assumptions in your analysis?
A. Any assumptions? I'm not sure I fully understand the question.
Q. Okay. When Mr. Chandler contacted you, he

asked you to look at -- did he provide you with the Bipartisan Center's report or --

A. Yeah, he alerted me to this and I read it and I got back to him and said "Gee, I think we could do some analysis with this if we could get the Fulton County data".

Q. Just for the record, the witness has identified what is the Bipartisan Policy Center report, or we'll just call it interchangeably the Bipartisan report, BPC report, if that's okay with you?

A. Yes.

Q. Okay. Who provided -- and you examined data from Fulton County, correct?

A. Yes. The data that was used for this report.

Q. I see. So let's go ahead and do some housekeeping stuff. I'll show you what we'll mark as Exhibit 1.

(Report of Doctor Stephen Graves marked Exhibit No. 1 for Identification.)

Q. Doctor Graves, I'm showing you what we've marked as Exhibit 1 which I believe is your report, certainly it's intended to be.

A. Yes.

Q. Let me go ahead and mark a composite exhibit, and composite exhibit just means there's a bunch of independent documents we'll treat as one as Exhibit 2.

(Packet of documents marked Exhibit No. 2 for Identification.)

Q. Is Exhibit 2 the data you reviewed from Fulton County, Georgia?

A. I think so. There were about 80 sheets and yeah, this looks like it -- this was the last one.

Q. Yeah, I'll represent to you I received that from plaintiff's counsel so if there's a page or two missing I'm certainly not trying to trick you.

A. I was just trying to judge the size.

Q. Understood. Who provided you with the Fulton County data? Did you get it from the BPC report authors or did you get it from plaintiff's counsel?

A. I got it, I guess, from plaintiff's counsel.

Q. I see.

A. My understanding was that they made a request to Fulton County to get that.

Q. Okay. Doctor Graves is one -- I'm sorry, you're Doctor Graves. Doctor Stewart is one of the authors of the BPC report?
A. Yes.
Q. He's here at MIT as well?
A. Yes.
Q. Have you talked to him about that report?
A. Yes.
Q. Tell me about that conversation.
A. Well, I think it was all by e-mail and when I read the report I asked him by e-mail if I could get the Fulton County data from him.
Q. Uh-huh. Did he provide it to you?
A. No.
Q. I see. Did he explain why or did he just not respond?
A. No, he responded and he just said that, you know, their agreement with all the precincts in all the counties that they worked with was that the data was for them and for their analysis and they weren't -- didn't have the right to share it with other people.
Q. I see. Did you talk about the substance of

the report at all with Doctor Stewart?
A. No.
Q. So is it fair to say that your analysis of the Fulton County wait times, as you talk about in your report, was done in some ways in a vacuum without discussion of any of the authors of the BPC report?
A. Yes.
Q. You've also attached to your report your curriculum vitae. Is the one we received, looks like the draft date was April 2019, is it still generally accurate?
A. Yes.
Q. Your principal -- you identify your principal field of interest as operations management and applied operations research. What does that mean in layman's terms?
A. Well, I'm primarily interested in the study of operations in terms of design, planning, improvement of operations, and that can be in the context of manufacturing systems, service systems, distribution systems, logistics systems.
Q. Okay. You don't have any -- you're not opining, though, on anything involving why

policymakers make certain decisions in this report; is that correct?
A. In which report?
Q. I'm sorry, in your expert report, you do not have an opinion about why policymakers, be they Fulton County policymakers or the State of Georgia policymakers, make certain decisions; is that correct?
A. Yes.
Q. Do you currently teach courses?
A. Yes.
Q. What are the courses that you teach?
A. Right now I'm teaching a course related to supply chains with particular applications to merging markets or developing markets.
Q. Have you ever taught a course on election administration?
A. No.
Q. Ever taught a course on elections generally?
A. No.
Q. Ever published an article on the issue of elections?
A. How do I answer this? I was involved in a commission that was set up post the 2000

election that involved a group of faculty from MIT and Cal. Tech, and I'm blanking on the exact name of that. We produced a report, sort of an ex-post report, of what happened in the 2000 election, and I was -- I contributed to that report.

Q. Okay. What did you examine with regards to the 2000 election?

A. The operations of an election site and the types of operational issues that arise in election science, basically, as a service system with queuing, waiting, so forth, how that happens, how that can be effective, how that can be improved.

Q. Did the report from the commission come to any conclusions, to your recollection, on wait times in particular?

A. That report -- well, yeah, I hesitate because it was a long time ago in terms of specific conclusions, but certainly the sense that, you know, election site is a service system with substantial -- can have substantial queueing, and then I think we spoke to the fact of what causes queueing and how you can better manage queueing wait

times in those types of contexts, so some of it is just sort of better process management, better training of election officials, you know, having sufficient amount of equipment, having clear process designs set up.

Q. In your examination of elections, be it going back to that commission up through the filing of your report, have you found that lines vary given the time of day?

A. Yes.

Q. When do you tend to see more lines at an election site?

A. Well, my understanding is that many election sites you'll see a large line when the poles opens, 7:00 a.m. People come early, they want to vote. That's one place where you'd have, would typically find long lines. You may also find it at other times during the day, depending upon the nature of the site and the, you know, the rhythms of the voters associated with that site so if it's -- you may have an end of day effect where people at the end of their workday go to vote, or occasionally there

might be a lunchtime bump too.
Q. So is it fair to say that in your experience in most voting sites the wait times can fluctuate, there's not a constant queueing?
MR. DuBOSE: Objection. So from time to time I may say objection. Doesn't mean that you should do or say anything differently, I'm just making a record for something I want to preserve with his question, so you can just go ahead, so don't mind me.
THE WITNESS: Okay.
A. So what was the question?
Q. Sure. In your experience in looking at election sites, is it fair to say that wait times can fluctuate throughout the day, that that would be the norm?
A. Yes.
MR. DuBOSE: Objection.
Q. Prior to this case you've testified, I saw, in two other election cases, is that right?
A. Yes.
Q. One is the Silberberg case in New York?
A. Yes.

Q. In that case you testified on behalf of New York City?
A. Yes.
Q. That case was about taking selfies in the election site, right?
A. Yes.
Q. Your conclusion was that taking selfies can delay, or cause delays in voting, is that fair?
A. Well, my conclusion, I think, was that taking selfies would basically increase the time it takes to vote, and because of that, the service time, the time for the process because of that, it can result in increased waiting.
Q. That's a much better way to put it than what I tried to do.
That was for an election in 2016, is that right?
A. I'm not sure it was for an election but it was -- I honestly can't recall how this came about but I thought there was the legislation to allow or disallow selfies, that was under study or under debate at that point in time.

Q. Your testimony, though, was in roughly 2016 or 2017?
A. Yes.
Q. Do you know at that time what type of voting equipment that New York City was using? Was it electronic or hand-marked paper ballot, that kind of thing?
A. I can't recall.
Q. Okay.
A. I think I knew at the time but I can't recall right now.
Q. You also testified in a case in the Eastern District in Michigan in 2018, that was A. Philip Randolph Institute versus Johnson case?
A. I don't know if it was 2018 but maybe 2018, 2017.
Q. I think the opinion came out in 2018. In that case, you testified for the State of Michigan, is that right?
A. Yes.
Q. You testified about straight ticket voting, is that right?
A. Yes.
Q. What was your conclusion in that case, if

you recall?
A. Well, I'm not sure I had a conclusion. My recall is that I was brought in to comment upon an expert report --
Q. Okay.
A. -- that was done by the, I guess, the plaintiffs, and my conclusion, as I recall, basically, was that the expert report had problems with it, and so I was -- my conclusion was more to raise questions with what that expert report was finding.
Q. Okay. I have some questions that I gained from reading through some of these. Would you agree with me that several things, several factors, can impact wait times at a poling site?
MR. DuBOSE: Objection.
A. Yes.
Q. One of those could be the method of voting, whether it's electronic or hand-marked ballots or somewhere in between. Is that something that could be a factor in impacting wait times?
A. Well, I wouldn't say it that way.
Q. Okay.

A. We tend to think of it as being the time it takes to do the task --
Q. Okay.
A. -- will affect.
Q. Do you have any opinion as to which -- well, never mind. Does the length of ballot, can that impact how long it takes to vote?
MR. DuBOSE: Objection.
A. I would say yes because it goes back to it's the time to do the task, and the time to do the task most likely will depend upon the length of the ballot.
Q. Okay. Let's take a look at your report, which is Exhibit 1, and specifically on Page 1, in the first paragraph you begin, it looks like the second sentence starts with, "based on my analysis that I report here." Can you just read that second sentence?
A. "Based on my analysis that I report here, it is my opinion that the general findings in the BPC/MIT report for the case of Fulton County in Georgia are accurately stated."

Q. And then it continues, "As shown, Fulton County, Georgia had the longest wait times of the 3,119 polling places surveyed nationwide. In the following, I will first describe the data and how it was collected, then the analysis and finally the results." Do you see that?
A. Yes.
Q. Is that the full breadth of your opinion, a summary of it, but do you have any opinions in this report other than what you've identified in that first paragraph?
MR. DuBOSE: Objection.
A. No. Yeah. No.
Q. You're not making any kind of causal analysis as to what may have caused wait times in Fulton County?
A. Yes, I am not making any causal statements.
Q. You're not opining on the intent of state policymakers with your report, correct?
A. Yes.
Q. You offer no opinion on the intent of county policymakers, correct?
A. Yes.
Q. You're not making -- your report contains

no opinion about whether county governments or state governments are responsible for the design of a polling site; is that correct?

A. Yes.

Q. Your report contains no opinion regarding who, and by "who" I mean county government or state government decides the type of resources that will go into a polling location; is that correct?

A. Yes.

Q. The analysis you conducted looked only at the 2018 general election, is that right?

A. Yes.

Q. I'm going to ask you a series of several questions that are going to sound very strange to you but it's based on my lack of knowledge, I promise you.

So we're on the same page, when you hear the phrase "sample set" as it relates to a statistical analysis, what does "sample set" mean to you?

A. Usually it means in some context that you have a population of things and when we say a "sample," we're taking a subset from that

population.
Q. Okay. How do you determine when you're conducting an statistical analysis, whether it's on statistics and durable development or elections, is there a standard by which to determine what is a sufficient sample size or sample set?
A. Well, sufficient for what purposes?
Q. For the analysis to be credible, trustworthy, sufficiently rigorous?
A. I mean, the answer is yes, but as to what that sample size is depends on, you know, what is it you're looking at.
Q. I noticed in your response to Trende's report you talk about a five percent gold standard in one of the analysis. Is there a similar kind of bright line gold standard as to what would constitute a sufficient sample to study -- we'll just focus on elections. Are you aware of any, it's 5 percent of polling locations or seven percent of polling locations, is there a bright line number like that that you're aware of?
A. No.

Q. Outside of elections, when you're analyzing other activity in the world of statistics or statistical analysis, is there a bright line standard by which people can say "that constitutes a sufficient sample." Does that question make sense?
A. Well, in effect it does, but it depends on what you're trying to do with the sample.
Q. Okay.
A. It's hard to answer or address in the abstract.
Q. So it varies by subject, is that fair?
A. Yes.
Q. You're not aware of a bright line that experts use in determining an appropriate sample set for measuring wait times at polling precincts?
MR. DuBOSE: Objection.
Q. Let me ask it this way. Are you aware of any accepted sample size in terms of percentage, i.e. percentage of polling locations, that is -- that provides a credible sample size when measuring wait times at polling locations?
MR. DuBOSE: Objection.

A. Again, my response depends on what you're trying to do, what the purpose of the analysis is.
Q. Let's take this. Your purpose in analyzing Fulton County polling sites was what?
A. Well, the purpose was primarily to, as said here, you know, to provide support for this report, you know. So in the context of Fulton County, replicating what they did here.
Q. In looking at Fulton County, were you satisfied with the number of precincts that returned data which is collectively submitted as Exhibit 2 to allow you to make a credible conclusion on Fulton County generally?
A. Well, again, I wasn't trying to make a conclusion about Fulton County in general.
Q. Okay. What were you trying to make a conclusion on then?
A. I was just trying to conclude that what was reported in this report seemed okay, was okay.
Q. Okay. Let me ask it this way, are you aware or were you aware when -- let me

phrase it this way. Presume that Fulton County in 2018 had 373 polling locations. I'll represent to you that's true, but for the purpose of today, let's presume that's the case. As I read your report, it looked like you received data from 83 polling locations. Does that sound correct?

A. Yeah. When you say a polling location, I gather this is a polling -- there's two precincts and one polling location.

Q. Right. We're only talking about polling locations today, because in Fulton you'll have, shoot, the one two away from me has, I think, eight precincts in it because the precincts are very small; mine has two because they're larger, but all we're talking about is actual polling.

A. Yeah.

Q. As I do very simple math, if I take 83 over 373, that's 22 percent of polling locations submitted data. Are you with me on that?

A. Yes.

Q. Sorry, that was one of the rules I have to tell you. You have to answer affirmatively or negatively. In your opinion, is

22 percent a sufficient sample size to make conclusions about wait times in Fulton County generally?

A. I would say yes, if those polling locations were chosen randomly.

Q. Do you have any basis to know why some locations submitted the line /HREUPBG data collection sheets and why some did not?

A. No, if I understand the question. I don't have an idea.

Q. Now, as I understand it, you -- as you went through what is Exhibit 2, the line link data collection sheets, you took out several because they were filled out incorrectly. I think the last one it copied incorrectly and you can't tell the number, so as I understand it from reading your report, there were ultimately 68 polling locations that you studied as part of your report; is that correct?

A. Yes.

Q. So as I divide 68 by 373, I get roughly 18 percent of the polling locations in Fulton County, does that sound right?

A. Yes.

Q. Is your conclusion on whether that is a sufficient sample the same, that it depends on whether they were chosen at random?
A. Well, as to whether or not one could extrapolate from this 68 to the rest will depend upon how this 68 were chosen. One way that they could have been chosen would be random, in which case I think it probably would be reasonable to extrapolate from the 68 to the rest, but there could be other ways that they could have been chosen.
Q. Okay. I don't know the answer to this, I truly don't. Do you know if the, and I think it's in the BPC report, I just don't recall, do you know if the data sheets were given to all precincts or polling locations in Fulton County?
A. My understanding from the BPC report is that yes, they were given to everybody.
Q. So in some ways we have self-selection in terms of who presented the reports and who did not. Is that fair?
MR. DuBOSE: Objection.
Q. In other words, the polling locations were

the ones to decide whether or not they were going to complete the report or not?

MR. DuBOSE: Objection.

A. Yes.

Q. Should -- if you were conducting a study perfectly -- that's not fair. If you were conducting the study, would you want the sample size, meaning those 68 or 83, in this case, polling locations that returned the data sheets, would it be more credible or result in a better analysis if those polling locations that returned the data sheets reflected the population or the demographics of Fulton County?

MR. DuBOSE: Objection.

A. I think you've asked two different things, so maybe I would ask that you --

Q. Sure, break it up?

A. Yeah.

Q. Let's presume, and I'll get the numbers wrong, but let's just presume hypothetically, Fulton is 48 percent black, would you want, for a study that looked at wait times and any impact that race has on, or any effect on correlation between race

and wait times, would you want the study to have or examine polling locations that reflected the population of the county? In other words, if you were to do a study that was mostly white polling locations, that would not be a good study, correct?

A. Yes, if I were trying to develop a sample and use that sample to make conclusions about Fulton County, I would want the sample to be representative of the demographics across the county.

Q. Okay. If you will turn in your report to what I believe is Index 2. These are, where it says polling sites, these are the polling sites that were included. This is the 68, if you will; is that correct?

A. Yes.

Q. Did you conduct any analysis as to whether these polling sites accurately, or generally even, reflected the population of Fulton County?

A. No.

Q. Let me ask a very basic question, and I know it's in your report, but tell me exactly what you did with the documents

that are in Exhibit 2. What kind of analysis did you perform?

A. Okay. It's relatively simple, but for every polling location, I would use the data to get an estimate of the average number in line over the course of the day.

Q. Okay.

A. So that's one thing I would do.

Q. How would you do that?

A. Well, in effect I would average these numbers but I sort of treat the 7:00 a.m. and the 7:00 p.m. numbers slightly different.

Q. Let me just, for the purpose of the record, when you say average these numbers, you're talking about those in the column numbered in line?

A. Yes. So it's pretty much an average but I make a slight adjustment for 7:00 a.m. and 7:00 p.m.

Q. Okay.

A. So that gives me an estimate of the average queue length or number in line, and so the other thing I want to know is what's the average arrival rate to the polling

location, and for that I would get the -- make an estimate of how many people voted on election day at the polling location, and I had two sources, possible sources, for that, so on these sheets, we asked them to report that -- they asked them to report that, the total voters checked in.

Q. Right.

A. So sometimes I would get a number from that.

Q. Okay. The example where you got the number, again, just for the court reporter and the record is the precincts O1P and it looks like O1E?

A. O1D and O1E, right, I believe so. It says 1268.

Q. Alright?

A. But then I would also crosscheck that with another data file that I got that reported the number of votes cast by each element on the ballot, so I looked at the number of votes cast for governor and I would take the bigger of those two numbers, if I had both those numbers, and if I only had the number of votes cast for governor, I just

used that number.
Q. When you say the bigger of the two numbers, you mean the one that would be demonstrated on the line link data collection sheet?
A. Yes.
Q. And the ones that were reported in your report, the certified election results, and take the bigger of those two?
A. Right, and that gives me for the day and then I make that into a rate, so I divide by 12 hours to get number of voters per hour or 12 times 60 to get number of votes per minute, and then given those two numbers -- let me say this right. I get an estimate of the average wait time by dividing the average line length by the arrival rate, and this is a well-known relationship from queueing theory known as Little's Law. Maybe I should also say and it is the same as what was done in the BPC report.
Q. Let me ask you to turn to, on that point, Page 14 in the BPC report.
A. Okay.
Q. I think this is where they come to that

same conclusion or analysis under Little's Law, do you see that?

A. Yes.

Q. If you'll turn to footnote 28 of that report. I should have looked at this before. On Page 14 it says "A core concept in queuing theory is Little's Law which states that in a stable system the long-term number of people waiting in line is equal to the long-term arrival rate multiplied by the average time a customer spends in the system." Do you see that?

A. Yes.

Q. You agree with that description?

A. Well, maybe, but it sort of depends what they mean by "a stable system."

Q. They define stable system in that footnote 28 which is on Page 39 of the BPC report.

A. Yes, and I see how they're defining it.

Q. Do you think that that is an accurate description of a stable system or definition?

A. Well, I take this as their definition of what they mean by a stable system.

Q. Do you think that's an accurate one?

A. I don't think that question has a right or wrong answer.
Q. Alright.
(Discussion off the record.)
Q. Okay. So let me ask it this way. The definition -- would you agree that for Little's Law to be applicable, there should be a stable environment or a stable system, I'm sorry, that is examined?
A. No. I've written a report, a paper on this, actually, with John Little and it's referenced in my report, but for Little's Law to apply, the conditions are that -- well, it can apply under various conditions, but one condition that it will apply for is if everything that goes into the system eventually leaves the system and it's that condition that applies to the election site that allows us to use Little's Law.
Q. Okay.
A. All the voters that come eventually leave the system and that there's no leakage or loss in the system and that as long as you have that, then we can apply this formula.

Q. Let me ask this question then. We've seen reports of persons coming and waiting in line and then leaving, line was too long, had some place to be, maybe they come back, maybe they don't. Does that impact the application -- presuming that's true, does that impact the application of Little's Law when studying election sites?
A. Yes, conceivably, but I think in a way that would make the wait time even greater than what we report because we're using the number of, primarily, the number of votes cast, so the number of people that entered, voted and left the system, and what you're pointing out is that there may have been additional people that entered and left the system before they voted.
Q. Right.
A. And we might not be capturing that, but to the extent that that happens, it would just exacerbate waiting in the system, so I would say that the estimates that we're producing might underestimate slightly the average wait time.
Q. But there's not a way, at least based on

the data as presented in the line link data collection sheets, Exhibit 2, to know if the persons who wait in line actually voted, is that fair?

MR. DuBOSE: Objection.

A. Yes.

Q. Let me ask a question about who -- talk generally about sample size. You found one precinct, I think it's Peachtree something, but it's the one that had the 78 minute wait, and you concluded that that was an outlier, so you did not count it as part of the 63 or so that were ultimately counted. Do you recall what I'm talking about?

A. Yes.

Q. You said that it was four standard deviations above the mean. Can you break that down for me? As a layperson I can look at it and see that that time was just way out of line with everybody else, but you analyze what way out of line means, and so can you tell me just from an outlier, is there a similar analysis, here it was four standard deviations above the mean, led you to conclude it was an outlier; is that

accurate?
A. Yes.
Q. In looking at outliers in general, is there a test that's used? Is two standard deviations above the mean an outlier, is it three? Does it vary? I'm trying to figure out how you conclude when something is an outlier?
A. Yes, my understanding is that if something were more than three standard deviations above the mean, it would raise questions, four, five, six would almost always be viewed as highly questionable and hence an outlier.
Q. Okay. So let's look at your analysis in the report under "Results," which I have is on Page 1. Tell me in that paragraph after, I guess the second paragraph, it says "The average wait time across the sites is 19.1 minutes with a standard deviation of 13.9 minutes. If we weighed the sites by the number of votes, then the average wait time becomes 18.6 minutes." What did you do to weight the sites by the number of votes? What was that

calculation?
A. The 19.1 minutes was, I would say, a simple average, so I had a wait time for every polling location, and I had, for this, 68 polling locations, so I just added them up and divided by 68. That's an average.
Q. Okay.
A. For the 18.6 minutes, what I do there, I take the wait time for every polling location, I multiply it by the number of voters at that polling location, I add those all up, and then I divide by the total number of voters, so in some sense, the wait times for polling locations with more voters get -- is more heavily weighted, more heavily counted.
Q. In the next paragraph there talks about the polling site, the outlier with the 79.4 minutes, and then when you remove that, you get 18.9 minutes as the average wait time. Do you see that?
A. Yes.
Q. That's across the 68 that you studied?
A. Well, now 67.
Q. That's right. Okay. So then next

paragraph talks about you plotted on a trend regression line. Tell me what, and I presume that's represented in the graph that's on the next page?

A. Yes.

Q. Tell me what a trend regression line is, and sorry, I'm asking very basic questions but the nature of the beast.

A. Well, we're just trying to find, you know, a linear relationship, a linear model, that sort of best fits the observed data where we have one observation for every polling location and here I was trying to, the linear model is modeling the wait time as a linear function of the fraction of registered voters that are African American, and I'm trying to find the best linear model that fits the data, and best here is, in this case, is usually done by minimizing the sum of the squared errors, so when I say, you know, associated with every polling location for a given line there will be an error, how far away is the point from the line, and it's common to sort of then square it to penalize even

more heavily points that are far, far away from the line.

Q. Let me ask you to look at that graph that's there in your report that has the linear regression analysis.

A. Yes.

Q. The X axis, one represents a polling site with 100 percent African American voters?

A. Yes.

Q. 60 on the Y axis represents 60 minutes of wait time?

A. Yes.

Q. Okay. Your report does not make any conclusions about the impact a line or waiting has on a person's decision to vote, in other words to stay in that line and vote; is that correct?

A. Yes.

Q. Okay. You conclude in the report, as I read it, that African Americans have a wait time 1.6 minutes on average more than white voters in the Fulton County polling locations you studied, is that right?

A. I would just characterize that as a finding, not a conclusion.

Q. Okay. Now I'm curious. What's the difference between a finding and a conclusion. Ok, I answered that. I got it. That's what I get for having a cup of decaf. this morning.

Now you've read, and we'll go ahead and mark as Exhibit 3, the report of Mr. Trende, correct?

A. Yes.

Q. Do you know Mr. Trende personally?

A. No.

(Trende report marked Exhibit No. 3 for Identification.)

Q. Is this the copy of the report that you reviewed?

A. Well, I think I just saw from Page 7 on but it may be I just printed out from Page 7 on. I think the first few pages are his background.

Q. Biographical?

A. Yeah.

Q. You're familiar with the analysis he conducts?

A. Yes.

Q. Let me now show you what we'll mark as

Exhibit 4.

(Response marked Exhibit No. 4 for Identification.)

Q. Is this something that you've authored, this response that's in Exhibit 4?

A. Yes.

Q. Okay. In your response which is Exhibit 4, on the first substantive page of the document, which is Page 2 as you have it, the second paragraph says -- well, let me start at the first. It says "I have two reactions to the report," meaning Trende's report, "which I discuss below. The first is that in my statement I did not assert that we found from the Fulton County sample a statistically significant relationship between the percentage African American's share and wait time at polling sites." Do you see that?

A. Yes.

Q. What does that mean? What are you saying there?

A. I'm saying that in my report I did not say there was a statistical relationship between wait time and percent African

Americans share at a polling location.
Q. Does that go back to that 1.6 minute difference?
A. I'm not sure I understand the question.
Q. Okay. So then let me ask it this way. That statement that we just read, that you did not assert you found -- let me ask you this. What would be a statistically significant relationship between percentage of African American share and wait time at a polling site? Is this statement more that you did not, and I'll ask it this way, and I'll probably draw an objection and I'll try to narrow it, but just so you know what I'm getting at. Is this statement saying that there was not a finding of a statistically significant relationship or that you weren't looking to determine if there was a statistically significant relationship? Do you see the difference in what I'm asking?
MR. DuBOSE: Objection.
A. Maybe.
Q. Let me ask it this way. Your report makes no factual finding that there is a

statistically significant relationship between the percentage of African American share and the wait time at the polls, correct?

A. Yes.

Q. Does it make a conclusion that there is a statistically significant relationship between percentage of African American share and wait time at the poll?

A. I'm not sure I see the difference between them.

Q. Okay. I'll move on. On Page 2 of your rebuttal, in the last full paragraph, you say "In describing one of Trende's hypothesis, "that my objection is with the relevance of the alternative hypothesis. There is a reasonable belief, as well as anecdotal evidence from past elections that African American voters have longer wait times than other voters." Do you see that?

A. Yes.

Q. What is the anecdotal evidence from past elections that you're relying on?

A. Well, I would sort of refer to, although not sure I could point explicitly to this,

but news stories that point out excessive amount of waiting that has occurred in previous elections at polling sites that are predominantly African American.

Q. In those news stories, are you saying that that is unique to Georgia?

A. No.

Q. Just so I understand the --

A. But in addition to that, it's pretty clear that was one of the main findings from the BPC report, as well as one can point to other studies that have made that finding.

Q. Just while we're on the topic of the BPC report, there are several times in the report that it refers to Georgia, but the analysis as I read it covered only those precincts, or polling locations in Fulton County. Is that your understanding as well?

A. Not exactly.

Q. Can you tell me?

A. Well, the BPC report here sort of reports on two things. One was the analysis it did based on the data it collected from polling locations that we've talked about.

Q. Right.
A. But it also reports on data that was collected by CCES, which is -- I'd have to find it. Congressional --
Q. CCES is good enough.
A. Yeah, so it's also reporting on that, so at times when it talks about Georgia it's referring to findings from the CCES survey and at other times on its own analysis.
Q. Just to be clear, if you look at Page 33 of the BPC report, that is there Appendix A where they describe participating jurisdictions?
A. Yes.
Q. If you look there, the only jurisdiction in Georgia is Fulton County, right?
A. Yes.
Q. Doctor Graves, I apologize for this, but can you walk me through your criticisms of Trende's report in terms of how you described his analysis, the hypothesis as being less relevant and then the analysis as being too stringent? I know those are two different things, but can you walk me through your thoughts on that?

MR. DuBOSE: Objection.
A. I'll try, and let me take an example.
Q. Sure.
A. So I have a coin. I want to know whether or not the coin is fair or not, and that's all I care about. Okay? So then statistically, I might flip it 100 times, and, you know, if I want to have some level of confidence whether it's fair or not, I'll set up, let's say, sort of rejection limits. I think I simulated this before but if I want to have sort of five percent confidence level, then I would reject the null hypothesis that it's fair if after I flip it 100 times, I have 60 heads or I have 60 tails so --
Q. Something's wrong?
A. Yeah, something's wrong. It's either coming up heads too often or tails too often, and that's sort of what we mean by a two-sided test, and it would be appropriate if, again, I have this coin and all I care about is is it a fair coin or not.
So an alternative setting is, think about I'm in a casino setting and I want to

know whether this coin favors the house or not, and by favoring the house it comes up heads too often, so then if I was doing statistical tests there, and if I wanted this five percent confidence level, if I flipped it 100 times, then I would reject the null hypothesis that it's fair if I came up with 58 heads.

Q. Because 58 exceeds 50 or 55?

A. Right, but 55 could happen by chance but if it were 58 heads, then I would think the house was up to something and it was fishy, and that's what we mean by a one-sided test. In some sense the -- well, the question was posed differently. The first question was is this coin fair or not, and someone says I don't have any other information. I don't have a leaning or a horse in the game, type thing, whereas this other setting is what I want to know is is this coin favoring the house or not, and if that's the question, then I use this one-sided test.

Q. Okay.

A. And then back to this. It seems to me that

what we care about here is, you know, do African American voters wait longer or not. At polling locations with predominantly African American voters, are they waiting longer than other polling locations, and if that's really what we care about, then in terms of statistical tests, we should use this one-sided test, and so that's the nature of my objection, whereas in the Trende expert report, everything he did was accurate but he was relying on a two-sided test.

Q. I see. Okay. So the two-sided test, going back to your coin analysis, is you just flip it up 100 times and you make a determination if it's -- you're not looking to see if it favors one side or the other, just is it fair?

A. Right, and say that could be biased one way or other way and both those ways mean it's unfair.

Q. So your analysis then is that, forgive me, your analysis is the two-sided test, which is are African Americans waiting longer at polling locations than whites in Fulton

County, is that accurate?
A. No, my analysis is what I would call a one-sided test.
Q. Okay. Thank you. Your analysis looks to, rather than me explain it, you tell me how your analysis is the one-sided test.
A. In statistics we have two hypothesis and we're trying to usually reject, see about rejecting the null hypothesis, and here the null hypothesis would be that there's not a positive relationship between wait time and the percent of African American voters at a polling location, and we're going to test that vis a vis an alternative hypothesis where the alternative hypothesis is there is a positive relationship between wait time and the percent of African American voters, so that's what I'm testing.
Q. Alright. Okay.
A. Whereas, I would say, do you want me to go on?
Q. Yes, whereas Trende --
A. Trende's null hypothesis is that there's no relationship between wait time and the percent of African American voters, that's

his null hypothesis, and then his alternative hypothesis against which he's testing is that there is a relationship and it could be either positive or negative.

Q. And as I think I heard you say and I read in the report, in terms of the math, you don't have any criticism of Trende's report, it's just how he's analyzing the topic, is that a fair way to put it?

A. Yes. I'm not sure I would say how he's analyzing but how he set up the analysis, how he's framed the question.

Q. Okay. You then, and this may go into that same line of questions we just had, but on Page 3 of your report, the substance is Page 4 of the document, in the third full paragraph starting with "thus." Midway through it says "This is a less stringent test but is more relevant for the given question at hand."

A. Yes.

Q. That means your test is a less stringent test?

A. Yes.

Q. What makes it less stringent than Trende's?

A. Well, it's sort of less demanding and in some sense it makes it, quote, easier to reject the null hypothesis. When I say easier, not that that's bad but it's more likely -- you know, it goes back to this coin flipping example, that if I had a one-sided test, I can reject the null hypothesis if I get 58 heads out of 100 flips.

Q. Right.

A. Whereas if I had a two-sided test, I would need 60 heads to reject the null hypothesis, so but I would also reject, in that case, the null hypothesis if I get 60 tails; whereas for the one-sided test, if I get 60 tails, that doesn't allow me to reject the null hypothesis.

Q. You talked about, in your explanation, a five percent confidence level, and your report refers to a five percent gold standard. Can you explain to me what you mean by that?

A. I guess I'm using colloquially the tradition within the scientific community we use five percent as being the gold

standard, as being the level that you would like to have to be able to assert with high level of confidence that, let's say, you're able to reject the null hypothesis.

Q. So as might be applied to this study, if you concluded that African American voters waited in longer lines -- well, let me ask it this way rather than me try to phrase it. How would that five percent confidence standard apply in a study of wait times. In other words, does the wait need to be five percent longer? I'm trying to determine how you applied --

A. Well --

MR. DuBOSE: Objection. Go ahead.

A. -- what I was trying to say at the end of the report was that I would think of the five percent standard -- now I'm venturing into the legal world, but as being comparable to beyond a reasonable standard of -- beyond a reasonable doubt standard as being five percent.

Q. Sure. Okay.

A. As being the top level of evidence that you might have.

Q. Okay. So is it fair to say then in some ways the disagreement you're having with Mr. Trende is a judgment call --

MR. DuBOSE: Objection.

Q. -- as opposed to something that's rooted in the calculations themselves?

MR. DuBOSE: Objection.

A. No.

Q. Why is that incorrect?

A. Could you start the question again?

Q. Sure. I guess what I'm trying to determine is, he has one set of hypothesis, you have a different set. We'll call it, for simplistic terms the one-sided or the two-sided as we talked about.

A. Right.

Q. Would you agree that both analysis could be effective in studying wait times in polling locations in Fulton County?

MR. DuBOSE: Objection.

A. Yeah, certainly what he did is accurate. My concern is that it doesn't strike me as being relevant, given the issue at hand is trying to understand do polling locations with a majority of African American voters

wait longer.
Q. Okay. If you will give me five minutes or so I think we can be wrapping up.
(Recess.)
Q. Doctor Graves, in the data that you analyzed for your report is limited to that which is in Exhibit 2; is that correct?
A. Well, yes, plus the data I got on number of votes cast.
Q. Correct.
A. As well as I got data on percent African American by polling location.
Q. So let me, a better way to phrase it is the data in your report is that which you site, which is, as you just described, Exhibit 2, the data sheets, and then the voting information from either the secretary of state's website or Fulton County's website; is that correct?
A. Yes.
MR. BELINFANTE: I have no further questions at this time.
(Whereupon the Deposition was concluded at 11:49 a.m.)

ATTACH TO THE DEPOSITION OF STEPHEN C. GRAVES, Ph.D.
CASE: FAIR FIGHT ACTION vs. RAFFENSPERGER

ERRATA SHEET

INSTRUCTIONS: After reading the transcript of your deposition, note any change or correction to your testimony and the reason therefor on this sheet. DO NOT make any marks or notations on the transcript volume itself. Sign and date this errata sheet (before a Notary Public, if required).

My expert Report is attached.

My hourly rate for these services is $300 per hour.

In 2017 I was engaged as an expert witness by New York City for

EVE SILBERBERG; JENNIFER REBECCA WHITE; AND MICHAEL EMPORER,
Plaintiffs,
- against -
BOARD OF ELECTIONS OF THE STATE OF NEW YORK, et al.,
Defendants
16 CV 8336 (PKC) .

And prepared a report, and was 'cross-examined' in court. (testified live)

Also in 2017, I was engaged as an expert witness by state of Michigan for

MI State A. Philip Randolph Institute, et al. v Ruth Johnson, USDC-ED No. 16-cv-11844.

I prepared a report and then testified by deposition.

Sincerely,

Stephen C. Graves

Stephen C. Graves

Waiting Times in Fulton County, November 2018 Election

Stephen C. Graves

December 2019

In this memorandum I report on the analysis that I did with election-day data from Fulton County. This data was collected as part of a nationwide study conducted by the Bipartisan Policy Center (BPC) and researchers from Massachusetts Institute of Technology (MIT), with an intent to estimate wait times at the polls during the 2018 midterms. Based on my analysis that I report here, it is my opinion that the general findings in the BPC/MIT report[1], for the case of Fulton County in Georgia are accurately stated. As shown in the BPC report, Fulton County, Georgia had the longest wait times of the 3,119 polling places surveyed nationwide. In the following I will first describe the data and how it was collected, then the analysis and finally the results.

Data

Each polling site in Fulton County was asked to record the number of voters waiting in line at hourly intervals, starting with the time at which the site opened and ending at the hour at which the site closed. In Fulton County, all sites opened at 7 AM and then closed at 7 PM.

In Appendix I of this note, I include an example of the data collection sheet. The BPC/MIT report, pp 11-13, provides a general overview of the data collection process.

For Fulton County, this data sheet was completed and collected from 83 polling sites. We obtained these data sheets from the county in response to an open records request. For each data sheet I made a judgment as to whether or not it was usable for my analysis.

Some sheets were deemed unusable because the poll worker recorded the wrong data; for instance, in each hour the number of votes cast was reported rather than the number of voters in line.

Other sheets were deemed unusable due to missing data. Here I had to make a judgment. If there were only a few missing observation, spread over the day, then I kept the data sheet if I thought that I could make a reasonable interpolation for the missing data from the recorded observations. However, if there were a substantial number of missing observations, or missing observations during critical times of the day (e.g., when the polls open), then I discarded the data sheet.

Based on this review of the data, I was able to use the data submitted from 68 polling sites, which account for 135 precincts. Over 59,000 voters voted at these polling sites on election day, 2018.

Analysis

For the data collected at each site, we can estimate the average wait time for a voter at that site. We accomplish this by an application of Little's Law[2] from queuing theory. An overview of the analysis is

---

[1] "The 2018 Voting Experience: Polling Place Lines", November 2019, available at https://bipartisanpolicy.org/report/the-2018-voting-experience/, by Mathew Weil, Charles Stewart III, Tim Harper, Christopher Thomas.

[2] Little, John DC, and Stephen C. Graves. "Little's law." *Building intuition*. Springer, Boston, MA, 2008. 81-100.

described in the BPC/MIT report, pp 14-16. More details and background on the analysis are in the report "Managing Polling Place Resources"[3].

The analysis requires the number of voters who cast ballots at each location. I used two sources of data to determine this count. One was the data sheets; however, many of the data sheets did not report this number. The second source was obtained from the web site https://results.enr.clarityelections.com/GA/Fulton/91700/Web02.221448/#/turnout, which provided counts of the number of votes cast for each candidate in each race. I used the total number of votes cast for governor as a count on the number of voters who cast ballots at each site; this count misses undervotes, and thus will under count the number of voters. Hence, for my analysis, I use the larger number from the two sources.

The estimates of wait time cover only the time period during which the polling site was open. In Fulton County this was from 7 AM to 7 PM. As such, these estimates do not include the time that voters might have waited before the site opened at 7 AM.

Results

In Appendix 2, I report the estimate of average wait time for each of the 68 polling sites for which we had usable data. The polling sites are denoted by the precincts that share the site. I also report my estimate of the number of voters on election day, and the fraction of registered voters that are Black for the site[4].

The average wait time across the sites is 19.1 minutes with a standard deviation of 13.9 minutes. If we weight the sites by the number of voters, then the average wait time becomes 18.6 minutes.

One polling site (precinct 6R) has an estimated wait time of 78.4 minutes. This is about four standard deviations above the mean, and as such, qualifies as an outlier. I decided to remove it from the sample so that it would not skew the analysis. After removing this site, the average wait time across the sites becomes 18.2 minutes with a standard deviation of 11.9 minutes. If we weight the sites by the number of voters, then the average wait time drops to 17.9 minutes.

In the figure below I plot the average wait time by the % Black registered voters at each polling site, and show a trend (regression) line. The regression shows the relationship between average wait time and the % of Black voters. As an interpretation, it says that the average wait time for a polling site with 0% Black voters (x = 0) is 16.2 minutes (y = 16.2), whereas the average wait time for a polling site with 100% Black voters (x = 1) is 20.5 minutes (y = 4.3 + 16.2 = 20.5). And that between these two extremes, the wait time grows by 0.43 minutes for each increase of 10% in the percent of Black voters.

For an additional analysis, I split the sites into two sets depending on whether or not the percent of Black registered voters was more of less than 50%. As is evident from the figure the sites separate quite cleanly into two sets, Black majority sites (with 26000 election day voters) and non-Black majority sites (with 32000 election day voters). For each set I then found the average wait time, weighted by the

[3] Stewart III, Charles. "Managing polling place resources." *Caltech/MIT Voting Technology Project Report* (2015).
[4] The data for number of registered voters and their race comes from "precinct locator file", available from Fulton county site: https://www.fultoncountyga.gov/services/voting-and-elections/precinct-locator

number of votes cast at each site. The average wait time for Black majority sites was 18.8 minutes, versus 17.2 minutes for non-Black majority sites, a difference of 1.6 minutes.

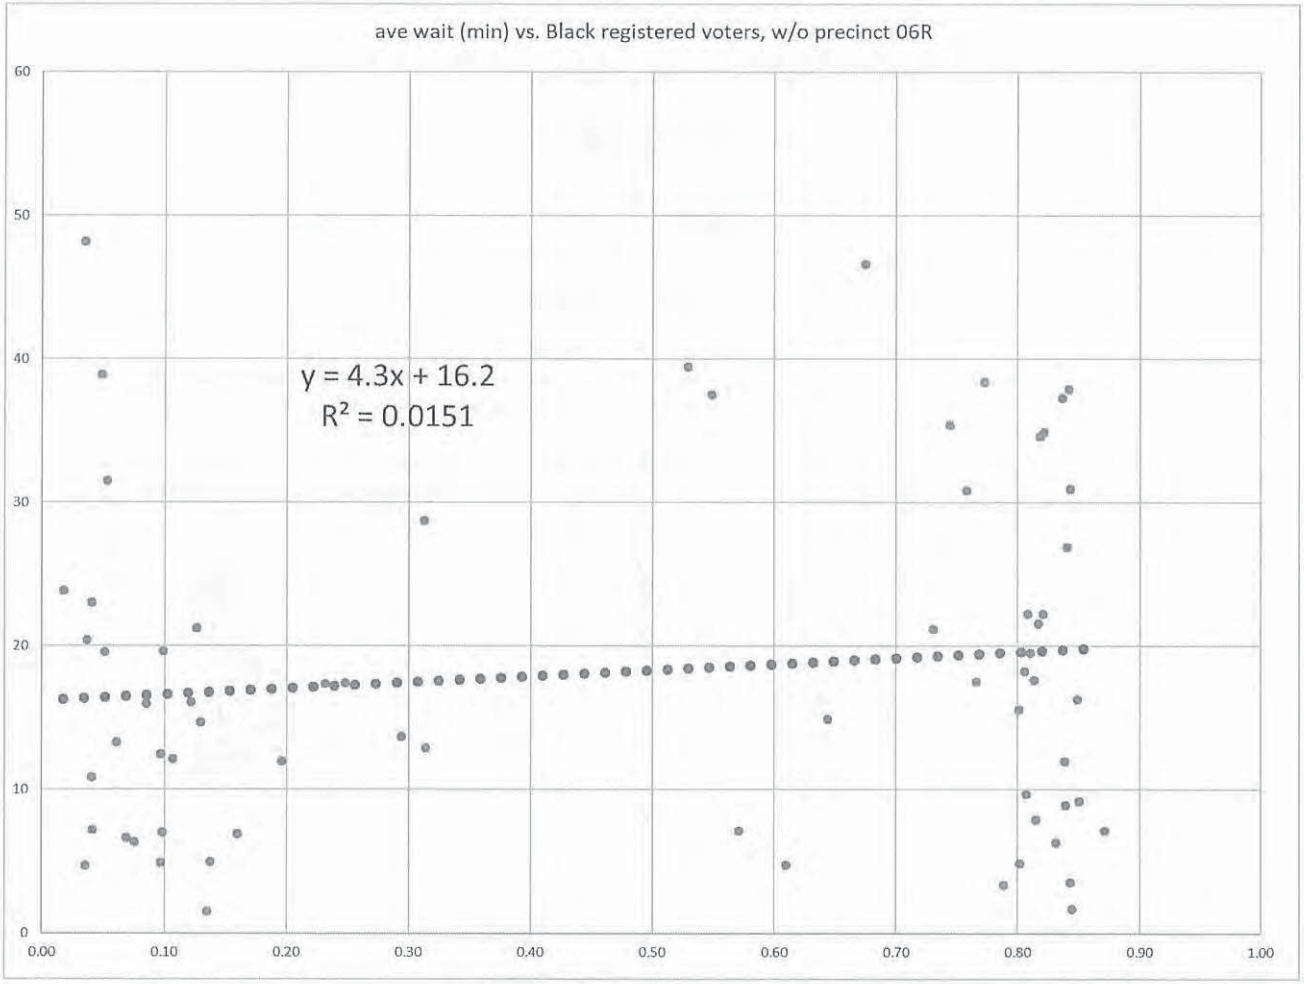

Figure: On the X-axis is the fraction of registered voters that are Black; on the Y-axis is the average wait time, in minutes. Each blue dot corresponds to a polling site. The red line is the trend or regression line fitted to these points.

Appendix I

Line Length Data Collection Sheet

(Fulton County, GA)

6 November 2018

Precinct: 03B, 03H, 04L

Number of Active Registered Voters: 3809

Please use this sheet to record the number of people in line to check in at the indicated times.

- If no one is in line, please enter a zero (0).
- If you are unable to record the line length at a particular time, please enter the number as close as you can to the appointed time. Enter an X if you failed to note the line length at a particular time.

TIME	NUMBER IN LINE	NUMBER OF ACTIVE EXPRESS POLLS	TOTAL VOTERS CHECKED IN
7:00 am*	22	2	0
8:00 am	1	2	69
9:00 am	2	2	122
10:00 am	4	2	171
11:00 am	3	2	217
12:00 pm	4	2	248
1:00 pm	3	1	277
2:00 pm	2	2	318
3:00 pm	8	2	356
4:00 pm	4	2	402
5:00 pm	0	2	451
6:00 pm	10	2	
7:00 pm	0	2	540

At what time did the last voter check in to vote? 7:00 pm.

*If the polls opened later than 7:05 am, please indicate when you opened here: N/A.

Please return the completed form in the Envelope labeled "Line Collection Forms."

Thank you!

Introduction

The 118.5 million Americans who cast ballots in 2018 represented the largest number ever to vote in a midterm election.[1] Although the number of people voting by mail has been steadily increasing over the past two decades, 2018 also set a record for the number of votes cast in-person in a midterm election, 91.2 million. This was a 39% increase in the number of in-person ballots cast compared with the last midterm election in 2014.

The good news is that despite the surge in turnout in 2018, unacceptably long lines to vote were infrequent. Among in-person voters, only 6% reported waiting more than 30 minutes before they could cast a ballot.[2] The bad news is that the percentage of voters reportedly waiting more than 30 minutes to vote doubled since 2014, when it was only 3%. By drilling down into the data, it's clear that in some states, the surge in long wait times was especially dramatic. Furthermore, disparities persist in states where voters do experience long lines, with long wait times more likely to occur in precincts with high minority populations, high population density, and low incomes.

The U.S. voting experience is a constantly changing playing field. Voters cast ballots by mail, in person at early voting sites, and through apps available to members of the military. But most voters nationwide still go to polling places on Election Day. Whether they experience no line, a short line, or an indefensible line is the outcome of many policy decisions. These include resource availability and deployment, precinct size and location, ballot length, poll workers, and timing.

For those precincts with unacceptably long lines in 2018, local election administrators need to diagnose what went wrong to ensure that problems do not re-emerge in 2020, when it is likely that turnout will be greater than in 2016, the last presidential election. Even so, for the voters in jurisdictions with lines less than 30 minutes long, the findings in this report will help policymakers and administrators to improve the voting experience in 2020 and beyond.

SUMMARY OF FINDINGS

This report documents the results of a nationwide study that the Bipartisan Policy Center and the Massachusetts Institute of Technology conducted in 3,119 individual polling places across the country to measure wait times at the polls during the 2018 midterms. It provides the type of fine-grained analysis of voters' reality as they waited to cast ballots that survey data cannot replicate.

As BPC and MIT found in a previous study of wait times during the 2016 election, long wait times in 2018 were primarily an early morning phenomenon. For the average voter in this study, there were only 7.8 people in line when they arrived at the polls at any point during Election Day. However, if they arrived right when polls opened, they faced a line of 21.2 people. At the same time, 35.8% of line measurements taken at precincts in the study showed no one waiting in line to vote, despite 2018 being the highest-turnout midterm election in a century.

The Presidential Commission on Election Administration (PCEA) recommended[3] that no voter should wait more than 30 minutes to vote. The average wait time in this study was 8.9 minutes; 4.8% of precincts saw wait times that exceeded 30 minutes, while 1.5% exceeded an hour.

The 3,119 precincts in the study represented 2.7% of the estimated 116,000 Election Day polling places nationwide.[4] Over 2.4 million voters visited these polling places on Election Day, representing 3.3% of all Election Day voters. The precincts in the study came from 211 local jurisdictions that were located in 11 states plus Washington, D.C. Among these 211 jurisdictions, 21 experienced average wait times of greater than 30 minutes in at least one polling place.

30 MINUTES TO VOTE

Too often the patchwork of election policies across the country creates barriers to voter-centric reform. BPC focuses on researching, developing, and making policy recommendations on the voting process that improve the voting experience.

The 30-minute benchmark for acceptable in-person wait times to vote was articulated in the final report of the bipartisan PCEA and has become generally accepted as the maximum acceptable wait time for voters under normal circumstances.[5] If voters arrive at the polls at a fairly stable pace, election officials can plan for this traffic, using online tools such as those made available by the Caltech/MIT Voting Technology Project (VTP) to assign resources—poll books, poll workers, and voting booths/machines—to keep lines to a manageable level.[6]

BPC and MIT's research, both in 2016 and in 2018, reveals one important exception to the proviso of voters arriving "at a fairly stable pace." A significant number of voters line up at the polls long before they open, creating an instant backlog at many polling places the moment the polls open. However, as this research also shows, *in most cases* these lines resolve within the first couple of hours of the voting day.

Therefore, in almost every case, the dynamics of polling place lines are predictable and within acceptable bounds. When unacceptably long lines do occur, that is typically because the precinct did not have sufficient staff and equipment resources to clear out the opening backlog at a steady pace. Other reputed causes of unreasonably long lines—such as a bus arriving with scores of voters in the middle of the day or hundreds of voters arriving all at once after business hours—certainly occur, but are the exception, not the rule.

CAUSES OF LONG LINES

One-off circumstances, such as unanticipated service failures or an unexpected influx in arrivals within a short window, can cause long lines. The data indicate, however, that policy decisions in certain states cause or exacerbate many of the longest lines and have led to long lines for years. Academic studies have identified structural causes of long lines such as resource availability and deployment, precinct size and location, ballot length, poll workers, and timing.[7,8]

CONSEQUENCES OF LONG LINES

Why be concerned about long wait times to vote? After all, one could argue that long lines are a sign of great voter interest and democratic fervor. Certainly, pictures of long lines of voters in elections in developing democracies are evidence that citizens of those countries are responding enthusiastically to the transition from tyranny. Be that as it may, the United States is not a developing democracy. It has conducted mass elections for centuries. In the jurisdictions most prone to long lines, large urbanized cities and counties, local governments already have access to scientific management techniques to guard against inconveniencing voters unnecessarily.

Scholarly research has demonstrated the real costs of making voters wait in line to vote. For instance, responses to the 2016 Voting and Registration Supplement of the Current Population Survey suggest that over 560,000 eligible voters failed to cast a ballot because of problems related to polling place management, including long lines.

Long lines also exact monetary costs. Research conducted for the PCEA estimated that the wage equivalent of the time spent waiting to vote in 2012 was over half a billion dollars, which was also about one-fifth of the total budget of local election offices in 2012.[9]

Long lines also influence future elections. In a dissertation written at Harvard University in 2017, Stephen Pettigrew used sophisticated statistical techniques to estimate how many people failed to vote in 2014 because of long lines in 2012. The answer, nearly 200,000, speaks to the persistent effects of long lines in the minds of voters.[10]

The likelihood that voters will stand in a long line is not equally distributed across the voting population. Relying on answers to the 2018 Cooperative Congressional Election Study (CCES), for instance, these are characteristics of voters who wait longer than others:

- African American (11.5 minutes) and Hispanic (11.7 minutes) voters waited longer, on average, than white voters (8.8 minutes).
- Early in-person voters (12.2 minutes) waited longer than Election Day voters (7.8 minutes).
- Residents of the most densely populated neighborhoods waited 25% longer than residents of the least densely populated neighborhoods.[11]
- Voters in Georgia (18 minutes) waited 23 times longer than voters in Vermont (46 seconds).

These factors regularly appear in academic studies of wait times.[12,13] Below is a look at how these factors influence line lengths and wait times in the BPC/MIT study.

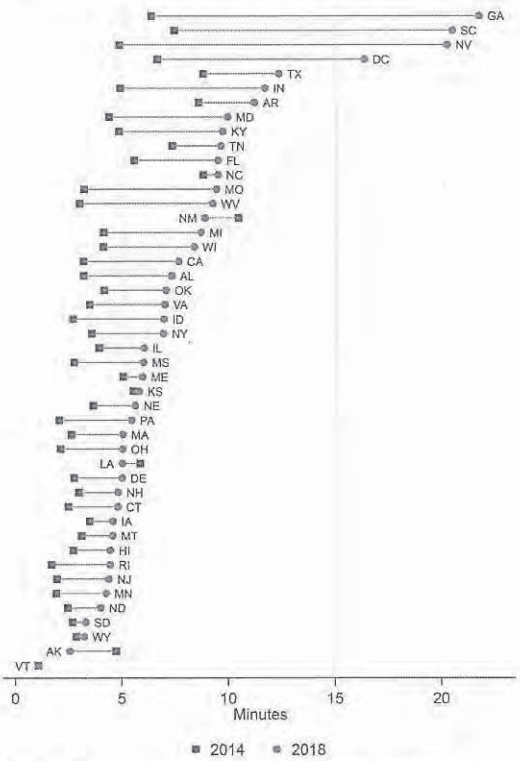
Still, based on two years of wait-time data from thousands of precincts across the country, it is clear that the typical voter experience doesn't involve waiting in a long line. Many of the one-off instances of lines in the study are a knock-on consequence—something went wrong in the polling place and was not resolved quickly. An example is equipment failure or a power outage. If an electronic poll book fails, the line can grow to extraordinary lengths in a matter of minutes if a replacement isn't available or if the failure is not resolvable locally with paper backup pollbooks. If replacements are unavailable or must be delivered from a warehouse across a large county, the line is likely to grow to the point that nothing can be done to ameliorate the problem until the polls close for the day.

Voting Lines in 2018: An Overview

Although the amount of time voters wait to cast a ballot is a major factor that determines the voter's overall opinion about the polling place experience, it is rare for jurisdictions to gather direct information about how long voters wait—this project is a major exception. And even the BPC/MIT Polling Place Line Study does not include participation from all states. Therefore, to gain insight into the typical experience of waiting to vote in 2018, researchers must rely on another source of data.

Luckily, for a decade the CCES has been asking voters how long they waited to vote, and the group did so again in 2018. Although answers to this survey question do not drill down to the precinct level like the BPC/MIT study does, it does sketch a broad portrait of waiting to vote in 2018 compared with wait times in past elections.

Figure 1: Average wait time to vote on Election Day, 2014 and 2018



Note: States omitted because fewer than 20% cast votes on Election Day: Arizona, Colorado, Oregon, Utah, and Washington
Source: CCES[17]

First, the BPC/MIT study examines average wait times. Looking only at respondents who voted in person on Election Day, the average reported wait time in 2018 was 8.7 minutes.[14] Keeping in mind the PCEA's 30-minute benchmark, 5.7% of Election Day voters reported waiting more than half an hour to vote.[15] These wait times were significantly greater than in 2014, the last midterm federal election, when 2.4% of Election Day voters waited more than half an hour and the average wait time was 4.5 minutes.[16] Figure 1 illustrates state averages in 2018 (red circles) compared with 2014 (blue squares).

Two things are notable about Figure 1. First, three states (Georgia, South Carolina, and Nevada) and the District of Columbia stand out compared with the other states in terms of how long voters waited to vote on Election Day. Georgia had a wait time of 21.7 minutes, or 2.5 times the national average.

Second, not only do the wait times of these three states and D.C. stand out compared

with other states in 2018, but the *change* from 2014 to 2018 also stands out. In 2014, 90% of the states—including Georgia, South Carolina, Nevada, and the District of Columbia—had an average wait time that ranged between 2.7 and 7.4 minutes. Thus, not only did these four states stand out in comparison with the other states in 2018, they stood out compared with the *change* in wait times from 2014 to 2018.

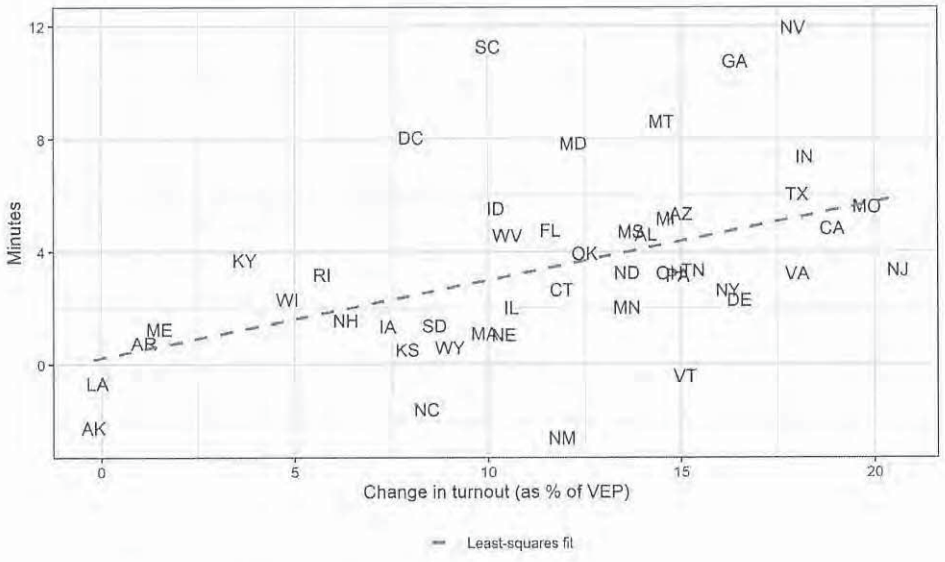
Why were wait times in 2018 double those of 2014? The most obvious answer is that turnout was greater in 2018—38% greater, when measured as a percentage of the voting-eligible population (VEP).[18] In fact, 2018 was the first time since 1912 that midterm turnout as a percentage of VEP was above 50%, which is closer to presidential election turnout levels.[19]

Because Little's Law, which is described below, explains that a main factor determining how long voters wait is the number of people who turn out to vote, it shouldn't be surprising that wait times were longer in 2018—especially if local officials did nothing else to affect wait times, such as change the number of check-in stations or speed up the check-in process.

Although the national turnout rate in 2018 was 38% greater in 2018 than in 2014, there was considerable variation across the states around this nationwide average. For instance, Utah saw an increase of 72%, while Alaska was essentially unchanged.

The reason why some states saw bigger turnout increases in 2018 than others is an important topic but not especially relevant for gaining an understanding of why wait times were longer in 2018 than in 2014. Whether turnout increased

Figure 2: Change in average wait time to vote on Election Day (2014 to 2018) plotted against change in voter turnout



Sources: CCES 2014 and 2018;[20] United States Election Project[21]

because of a more energized electorate, changes to voter registration laws, or interest in particular races, the more turnout increases, the more polling places feel pressure to accommodate the increase in voters.

If increased turnout is the reason why wait times in 2018 were greater than in 2014, then there should be a high correlation between the turnout change between 2014 and 2018 and the wait-time change. Figure 2 illustrates that there is a correlation, although it is not "high."[22] In the figure, the horizontal axis shows the change in turnout from 2014 to 2018, while the vertical axis shows the increase in wait times. The red line shows the best-fit line through the data points.[23]

On average, states that saw larger increases in turnout also experienced larger increases in Election Day wait times. Still, not all states with big turnout surges saw equally large increases in wait times. New Jersey and Virginia are examples of states that saw significant turnout increases but experienced relatively moderate increases in wait times.

The scatterplot in Figure 2 shows that dramatic turnout increases do not explain the large increases in wait times in Georgia, South Carolina, Nevada, and the District of Columbia. Several states with equally large turnout increases saw relatively minor increases in their wait times. It must be the case that the states that experienced big wait-time increases in 2018 pushed the resources at hand, mainly check-in locations and voting machines, to their capacity limits or beyond. These issues will be explored further below.

The BPC/MIT Polling Place Line Study

BPC and MIT joined together to create the BPC/MIT Polling Place Line Study. It is a program with a simple goal: to provide local election jurisdictions with actionable data about the lines that formed at their polling places, mostly on Election Day, but in some cases, during early voting. Academic projects conducted in the 2014 and 2016 elections informed the BPC/MIT program, but the study featured one important constraint: The method of collecting data had to be simple and easily implemented by poll workers. To that end, researchers developed a simple coding sheet and a set of instructions that helped poll workers record the number of people standing in line during every hour of the voting day.

All told, 211 local jurisdictions provided usable data for the program in 2018, ranging from Metz Township, MI, with 230 registered voters, to San Diego County, CA, with nearly 3 million registered voters.

The BPC/MIT Polling Place Line Study is extremely simple to implement; the designers were mindful of not adding too much extra time and effort to a poll worker's already busy job description. Researchers estimate the amount of time that a poll worker spent collecting line information was less than one minute at the top of each hour. Every hour, starting when the polling place opened, the poll worker simply had to count how many people were standing in the check-in line and record that single number on a handwritten sheet along with the number of poll books available at the time. Figure 3 shows a typical data-collection form.

Figure 3: Typical data-collection form

Line Length Data Collection Sheet
Bedford County, Virginia
November 6, 2018

Precinct: #104 Stewartsville Rescue Squad

Instructions. Please use this sheet to record the number of people standing in line to check in to vote *plus* the number checking in at the indicated times, along with the number of poll books available to accept voters to check in.

If there is no one standing in line at the indicated time *and* no one checking in, please enter a zero ("0").

If you are unable to record the line length at a particular time, enter an "X" in the corresponding space.

Time	Number in line†	Number of poll books
When polls open @ 6:00 a.m.*	9	2
7:00 a.m.	0	2
8:00 a.m.	2	2
9:00 a.m.	3	2
10:00 a.m.	0	2

6:00 p.m.	3	2
7:00 p.m.	0	2

†Include the number checking in at that time.

At what time did the last voter check in to vote? 6:40pm

*If the polls opened at some time other than 6:00 a.m., indicate that time here: ____

Source: BPC/MIT[24]

At the end of Election Day, the participating counties and municipalities collected all the sheets from their polling places and sent them to BPC or MIT. MIT then keyed in the data and produced an individualized report for each county. After Election Day, MIT gathered data about the number of voters who turned out in person at each of the polling places in the study. (This information was easy to gather from the reports issued by the local jurisdictions in the course of canvassing the election results.)

Each local jurisdiction received a report that contained at least two parts. The first was a spreadsheet of the data that poll workers had collected on the paper coding forms. The second part of the report calculated the average number of people in line, or line length, during the day; also, by using turnout information, the report calculated the average wait time to vote at each precinct in the jurisdiction. (See below for a discussion on how this calculation was performed.)

Figure 4 shows an example of this kind of report. Election Day turnout was based on official reports published by the local jurisdictions that researchers used to calculate the arrivals-per-minute simply by dividing Election Day turnout by the number of minutes the polls were open during the day. Then, we calculated average line length directly from the observational data provided by the participating jurisdictions. The average wait-time calculations for each precinct used Little's Law, described in greater detail below.

Figure 4: Example precinct wait-time report (excerpt)

Counties that were able to provide hourly data about voter check-ins from their e-poll-book systems received an additional report. This report calculated how many voters had arrived at the polling place each hour. The details of the report each jurisdiction received is illustrated by the graph in Figure 5, which displays the data provided by the county for one particular precinct, includes the line length at the start of each hour (the solid gray line), the number of check-ins each hour (the red line), and when the voters arrived (the blue line).

Figure 5: Typical graph showing hourly precinct arrivals, check-ins, and number of voters waiting in line

The Science Behind the BPC/MIT Polling Place Line Study

The foundation of the BPC/MIT Polling Place Line Study is queuing theory, a field of management science and operations research that characterizes how long it takes to provide services to customers—be they grocery store patrons, medical office patrons, or cars exiting a parking lot—in terms of three major factors: (1) the arrival patterns of customers, (2) how long it takes to serve customers, and (3) how many stations, such as check-out stands, customers can be served at. Although there are limitations in drawing analogies between voters and customers, in the case of managing polling places, the analogy is very apt.

A full description of the science behind the program can be found in *Managing Polling Place Resources*, published by the VTP in 2015.[27]

A core concept in queuing theory is Little's Law, which states that in a stable system,[28] the long-term number of people waiting in line is equal to the long-term arrival rate multiplied by the average time a customer spends in the system. Using a little algebra, if one knows the arrival rate at a polling place and the average number of people in the check-in line to vote, one can then calculate the average wait time at a polling place with the following equation:

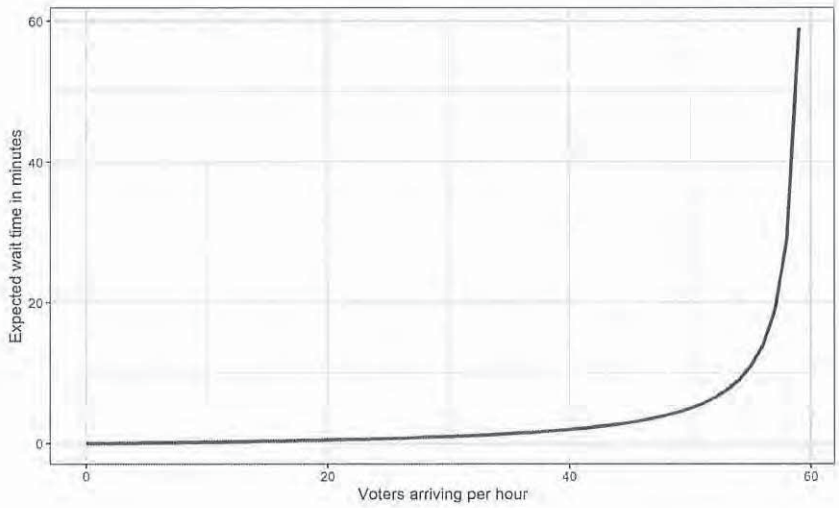
$$\textit{Average wait time} = \frac{\textit{Average line length}}{\textit{Arrival rate}}$$

The jurisdictions involved in the BPC/MIT Polling Place Line Study provided the number of people who voted on Election Day at each of the precincts in the study. Using the information from the data-collection forms already discussed, the average line length was calculated using the Little's Law formula.

There are other methods to calculate average wait times. In particular, if one knows the number of check-in stations in a polling place, how long it takes to check in a voter, and the arrival rate of voters, it is possible to estimate the average wait time to check-in. The VTP polling place toolkit website contains a spreadsheet that election officials can use to make this calculation and see whether they have enough resources in polling places to keep wait times to reasonable lengths.[29]

Using calculations from this spreadsheet, one can demonstrate how wait times fluctuate from election to election as the turnout level fluctuates. Consider a typical polling place with one check-in station that that is open for a 12-hour voting day and that can check in a voter in one minute, on average. Figure 6 graphs how average wait times change as the hourly arrival rate varied from zero to 60 voters per hour.

Figure 6: Example of how wait times to vote vary as the number of voters arriving per hour varies



The primary insight in this example is that there is virtually no wait to vote across all values of arrival rates, but when the arrival rate reaches a critical point, the expected wait time increases exponentially. With 40 voters per hour, the average wait time is only two minutes; at 50 voters, it is five minutes; at 55 voters, the wait time is 11 minutes; and at 59 voters per hour, the wait time is almost an hour.

The sharp inflection of the graph at around 55 voters is sometimes called the "elbow of death," as the arrival rate approaches the polling place's "utilization limit" of 60 voter check-ins per hour.[30]

The example shown in Figure 6 is relevant to understand why some states—or precincts—can see big increases in turnout and yet not see wait times increase, while others can see similar turnout increases and see wait times explode. If a precinct's arrival rate was previously far from its utilization limit, it can more easily absorb an increase in turnout than a precinct that was previously close to its limit.

In this example, a precinct (Precinct A) that had previously had an arrival rate of 30 voters per hour, far from the utilization limit, and then experienced an increase in the arrival rate to 42 voters per hour would see its average wait time

increase from one minute to 2.3 minutes. Another precinct (Precinct B) that had previously had an arrival rate of 45 voters per hour, much closer to the utilization limit, would see its wait time increase from three to 19 minutes if it experienced the identical arrival-rate increase of 12 voters per hour. Furthermore, 21% of voters would wait more than 30 minutes in Precinct B; 5% would wait more than an hour. (Practically no one would wait more than 30 minutes to vote in Precinct A, even at an arrival rate of 42 voters per hour.)

The states and local jurisdictions that saw the biggest increases in wait times in 2018, such as Georgia, South Carolina, Nevada, and D.C., probably were near their own local utilization limits in 2014, and thus near the elbow of death. With a dramatic increase in turnout, but without an adequate increase in resources, such as voting machines and poll books, wait times exploded. The other states that saw similar turnout increases in 2018 but experienced minor wait-time increases, such as Virginia and New Jersey, probably had few precincts near the elbow in 2014, resulting in greater polling place resilience when the surge hit in 2018.[31]

It is significant that most of the states with the biggest increases in wait times rely heavily on electronic voting machines, both direct-recording electronic machines and ballot-marking devices, and thus cannot easily or inexpensively expand polling place capacity whenever turnout surges. Therefore, it seems especially important for states with electronic machines to assess their resource needs well in advance of elections that might see big turnout surges.

The Results of the BPC/MIT Polling Place Line Study in 2018

Clearly, there are a variety of ways to manage long Election Day lines. To take a narrower focus, it's valuable to examine the results of the BPC/MIT Polling Place Line Study, to look at who participated, and to learn generally from the data gathered.

BPC put out a nationwide call, asking for local jurisdictions to participate in the program in 2018. BPC made every effort to encourage jurisdictions of all types from across the country to participate. Still, this was a voluntary program, so the jurisdictions were not chosen randomly.

Nonetheless, the demographic characteristics of the precincts included in this study closely correspond to nationwide demographics. This correspondence can be tested using data from the political data firm Catalist, a company that provides voter file information to campaigns.

As Table 1 shows, the demographic (and other) characteristics of the participating jurisdictions are very similar to the characteristics of local jurisdictions nationwide. The sample of jurisdictions has slightly greater African American populations, more college graduates, and more renters than nationwide. This probably reflects the fact that a few very large urbanized jurisdictions were part of the program, whereas the smallest and most rural jurisdictions primarily came from three states—Connecticut, Michigan, and Virginia—that had statewide participation programs. Later in this report, it will be shown that precincts with large minority populations tend to have longer wait times than precincts that are nearly all white. Thus, this report's estimates of average wait times may slightly overestimate the true national average. Because the oversampling of predominantly African American precincts is slight, it is likely that the overestimate of national wait times is also slight.

Table 1

Demographics vs. Catalist Data

	Sample	Nationwide
White	75.4%	77.4%
Black	11.8%	10.2%
Hispanic	6.9%	7.6%
Other race	6.0%	4.8%
Over 65	24.8%	25.3%
College graduates	38.9%	32.1%
Living in poverty	10.5%	11.8%
Renters	10.6%	7.6%

WHO PARTICIPATED IN THE PROGRAM?

The BPC/MIT Polling Place Line Study in 2018 included 219 local jurisdictions, of which 211 produced Election Day line data that was usable for this report.

Appendix A lists the 211 jurisdictions that provided usable polling place line data in 2018.

These jurisdictions covered a broad swath of the United States. By the numbers:

- 11 states, plus the District of Columbia
- 18.0 million registered voters[32]
- 10.5 million votes cast, or 9% of nationwide turnout
- 3,119 precincts

All told, the jurisdictions provided more than 41,000 hourly records of line-length data. Coupled with the 2016 effort, this represents the largest, most broad-based observational study ever conducted of wait times in polling places.

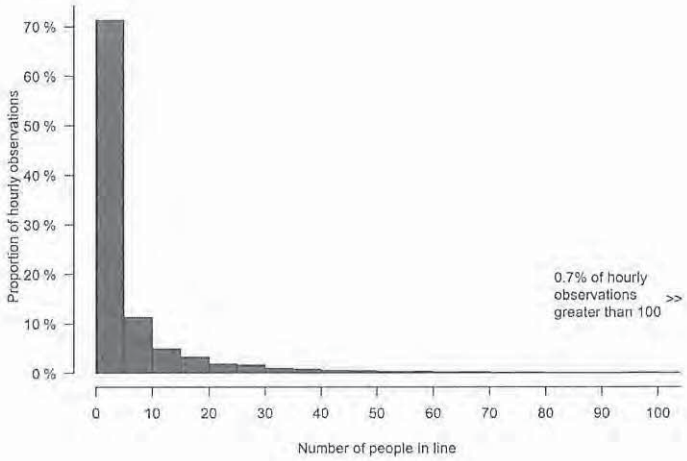
FINDINGS

There are six main empirical findings that are important to emphasize.

1. **The average number of people in line at any given time was 7.8. However, this average masks an important detail: Most lines were very short, but a few were very long.**

The graph in Figure 7 shows the distribution of the number of people standing in line each hour for the precincts included in the study. The average line length was 7.8 people. However, a small number of precincts that experienced incredibly long lines strongly influences this average. Compare the average with the median number of people in line, which is just two. In other words, half of the hourly line counts were longer than two people and half were shorter. Finally, the modal (that is, the most common) number of people in line at any hourly observation was zero. Overall, just over one-third (35%) of all the recordings in the data had nobody in line at all.

Figure 7: Distribution of all 41,264 observed hourly line lengths across 3,119 voting locations in the 2018 election

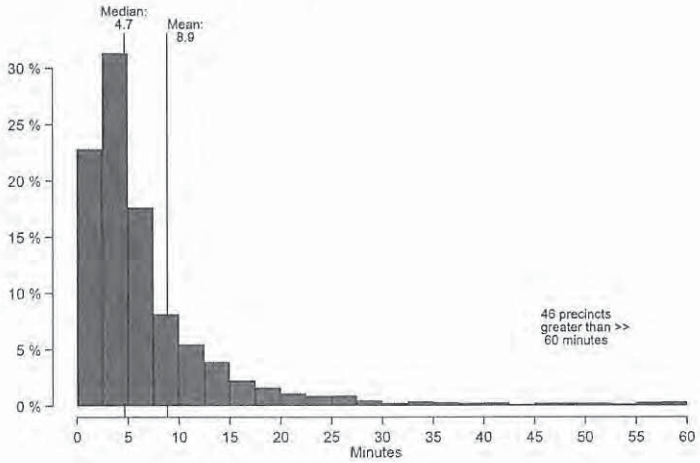


Source: BPC/MIT[33]

A major challenge of running an election is not about understanding how long lines will be *on average*. Instead, election officials must account for how long the line will be *at its worst*. Another way of exploring the line-length data is to ask how long the *longest* line was for each precinct in the sample. For 70% of precincts, there were 10 or more people in line at least once during the day. Put another way, 30% of precincts *never* had more than 10 people in line throughout the entire time they were open.[34] Only 13% experienced a line of 50 or more during the day. Finally, just one in 30 precincts (3.3%) had more than 100 people standing in line to vote at least once during the day.

2. **The average wait time for precincts in the study was 8.9 minutes. The small number of precincts with very long average wait times also influenced this result. In addition, only a small proportion of precincts had average wait times of greater than 30 minutes.**

Figure 8: Average wait times in 3,119 polling places



Source: BPC/MIT[35]

In all, there was enough data to calculate the average hourly wait time in 97.6% of the precincts in the study (3,043 out of 3,119). Figure 8 shows the estimated average wait time for voters in these polling places. In most areas, lines were typically very short. The mean wait time across these precincts was 8.9 minutes; the median was just 4.7 minutes. Just over three-quarters (78.7%) of precincts had an average wait time of less than 10 minutes. These findings are largely consistent with survey-based estimates of average wait times from the 2018 election, which found that 76% of voters waited less than 10 minutes to vote.

However, some areas had much longer wait times. At the high end, one out of 20 (4.8%) precincts had average wait times that were longer than 30 minutes.

3. **Average wait times are longer in precincts with a high percentage of minority voters, more renters, and lower incomes.**

One of the most important policy questions in recent years has been about the relationship between polling place wait times and demographic factors, particularly race. Until very recently, the statistical correlation between the race of a voter and the waiting time to vote has been based on public-opinion studies. These studies have regularly found that African American and Hispanic voters wait longer to vote than whites.

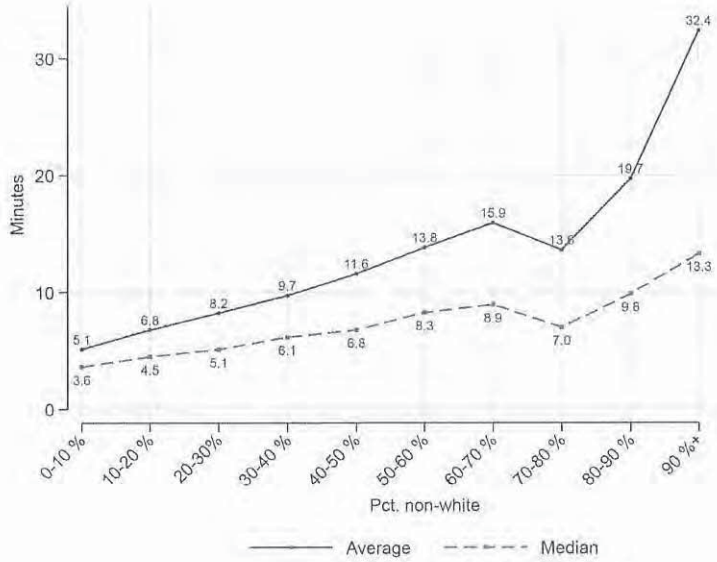
The findings in the BPC/MIT report are consistent with public-opinion-based studies.

Public-opinion surveys are valuable for exploring the perceptions voters have formed about their voting experience and for characterizing those experiences nationwide. One limitation of public-opinion surveys is that they rely on voters' memories, which can become clouded over time and influenced by what they hear others report. An advantage of direct-observation studies, such as this one, is that they directly measure wait times and don't depend on the recall of voters.

This study, therefore, provides a good opportunity to verify public-opinion studies that have previously correlated demographic factors with wait times. BPC and MIT have been able to match most of the precincts from the study with demographic data obtained from Catalist. Using this matched data, we can see whether demographic characteristics of polling places are correlated with wait times without public-opinion surveys.

First, precincts with a higher proportion of minority voters tend to have longer wait times than precincts that are predominantly white. Figure 9 illustrates this finding; it graphs the average wait time as a function of the percentage of registered voters in a precinct who are non-white.

Figure 9: Average wait times as a function of percent that is non-white



Source: BPC/MIT[36]

Consistent with past studies, the more voters in a precinct who are non-white, the longer the wait times. In precincts with 10% or less non-white voters, the average wait time was 5.1 minutes, the median was 3.6. In precincts with 90% or more non-white voters, the average and median climb to 32.4 and 13.3 minutes, respectively.

Two patterns are particularly important to notice in Figure 9. First, the mean and median are fairly close to each other in precincts with low non-white populations, and then they diverge significantly in precincts with high non-white populations.

Because outliers strongly influence averages, this divergence between the mean and median wait times indicates that in predominantly minority precincts, there are a few precincts with exceptionally long wait times that are pulling up the average. This is not to dismiss problems experienced in precincts with greater than 80% minority populations. But it is to suggest that the few precincts that have extraordinarily long lines are disproportionately in minority communities.

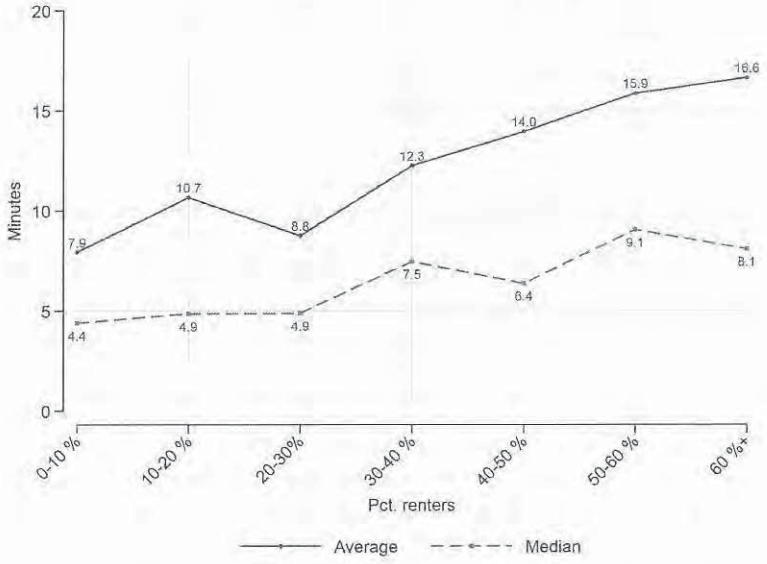
The second pattern is related to the first. The average and median wait times march upward in a fairly linear fashion in the range of 0% to 70% minority population, then the average begins to grow exponentially. This underscores that the mismatch between resources and voting demand is especially great in precincts with a large fraction of minority voters.

Another demographic of interest is the percentage of the population who are renters. A large rental population implies an area with a great deal of population turnover. With high population turnover, two factors might

increase wait times: (1) new voters, whose inexperience with the process may slow down check-in and voting times; and (2) highly mobile voters who may find themselves in the wrong precinct on Election Day and thus casting provisional ballots, another process that can slow down lines.

Precincts in areas with more renters, in fact, experience longer wait times, as illustrated by Figure 10. The relationship is not as dramatic as that seen with race, but the pattern occurs, nonetheless. In precincts where fewer than 10% of residents are renters, the mean wait time was 7.9 minutes and the median was 4.4 minutes. In the few precincts where the rental rate exceeded 60%, the average grew to 16.6 minutes, with the median at 8.1 minutes. Finally, as discussed above,

Figure 10: Average wait times as a function of percent who are renters



Source: BPC/MIT[37]

the fact that the mean and median are fairly close in low-rental areas suggests that there are many fewer precincts with exceptionally high wait times. This is in contrast to the high-rental areas, where the mean and median are quite far apart.

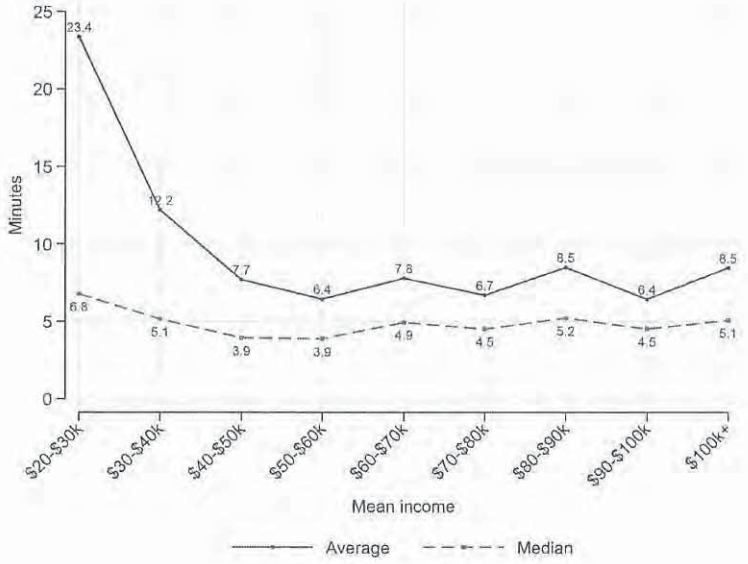
A final demographic factor of wait times is income. Income is correlated with a number of factors that might cause long lines. One is political clout; election officials representing jurisdictions with higher average incomes may be more successful in agitating for extra resources if wait times creep up.[38]

As Figure 11 shows, the correlation between a precinct's income and wait times is largely determined by especially long wait times in the lowest-income areas. Considered together, the average wait time in precincts with an average income of less than $40,000 is 15.4 minutes, compared with 7.7 minutes in other precincts. Beyond average incomes of $40,000, average wait times are relatively flat, fluctuating randomly.

Interestingly enough, the median wait time, 4.7 minutes, is essentially constant for all levels of average income. This means that low-income precincts are much more likely to experience exceptionally long lines than middle- and upper-income precincts. For instance, 3.4% of the precincts with average incomes of less than $40,000 had average wait times of greater than 30 minutes. This contrasts with 0.7% of precincts with higher average incomes. In other words, precincts in areas with average incomes of less than $40,000 were four times more likely to experience wait times of greater than 30 minutes than precincts in areas with incomes above that.

Of course, the three demographic factors discussed here are all correlate with each other. Precincts with high minority populations tend to have lower average

Figure 11: Average wait times as a function of average income



Source: BPC/MIT[39]

incomes and more renters. Which factor has the most statistical power in explaining average wait times?

The answer is race. A simple statistical model provides the answer; Appendix B reports its results. In summary, it is the case that race and the percentage of renters individually show statistically significant influences on average wait times. However, once researchers explore all three demographics simultaneously, the only factor that retains explanatory power is race.[40] The analysis suggests that the difference in wait times between a precinct that is 100% non-white and one that is 100% white is 20 minutes.

This effect is quite large, but consistent with other studies. Unfortunately, we did not design this study to explore the causes of wait times beyond easily measured factors such as demographics and arrival rates. The small amount

of research that has probed this question suggests that longer lines in minority-dominated precincts are primarily due to local differences in political influence, which result in minority precincts being less well-supported on Election Day.[41,42,43,44]

4. **The longest lines tended to occur in the morning, right after the polls opened.**

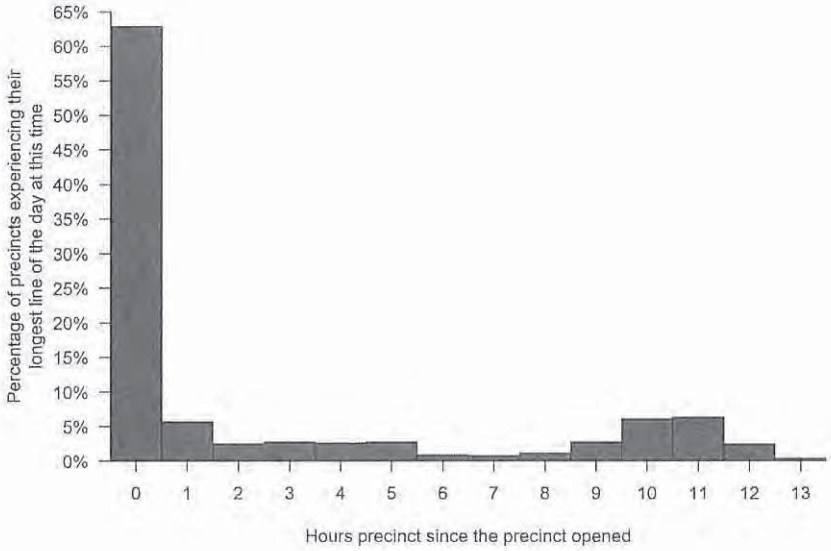
When Americans vote on Election Day, they tend to vote in the morning. According to the 2014 Survey of the Performance of American Elections, the last time the survey was conducted during a midterm election, 22% of Election Day voters had cast a vote by 9 a.m. and 48% had voted by noon. The statistics for 2016 were very similar—24% and 56%, respectively.

Across all the precincts reflected in this study, the longest lines tended to be present the moment the polls opened, which was due to the large number of voters who lined up early. Lines during the first couple of hours of voting remained long even in the best of circumstances because the large number of voters who arrived before work hours encountered the backlog of voters caused by the opening queue.

Figure 5 above provides an example of this pattern; it showed the arrival, check-in, and line-length dynamics of a representative precinct. In that example, 35 people were waiting in line to vote when the precinct opened at 8 a.m. Between 8 and 9 a.m., another 52 people arrived. Because the poll workers were able to check in 57 people during that first hour, the line shrank from 35 at 8 a.m. to 30 at 9 a.m. In the first couple of hours of voting, poll workers were unable to clear the backlog of voters created by the line of voters already in place when the polls opened. It was only late in the day, when hourly arrivals eased up a bit, that the line began to steadily drop. (It also helped that for the 11 a.m.-to-noon hour, the number of voters that poll workers were able to check in surged by about 50% for that one hour, allowing more of the line to clear.)

To highlight the more general point, the graph in Figure 12 presents the hour in which each precinct in the study reported its longest line on Election Day. To account for different precinct opening times in different jurisdictions, the x-axis of the graph displays the number of hours since the precinct opened. (For instance, if the polls opened at 7 a.m. and the longest line appeared at that time, the results for the opening hour are reported for Hour 0. If the longest line occurred at 8 a.m., the line is reported as occurring at Hour 1.) The y-axis shows the proportion of precincts that experienced their longest lines at this time.

Figure 12: When did precincts experience the longest line of the day?



Source: BPC/MIT[45]

The overwhelming majority of Election Day precincts, 63%, had their longest lines when the doors opened. An additional 6% had their longest lines during the first hour of voting. In other words, 69% of Election Day precincts had their longest lines within the first hour of voting, with the lines declining after that.

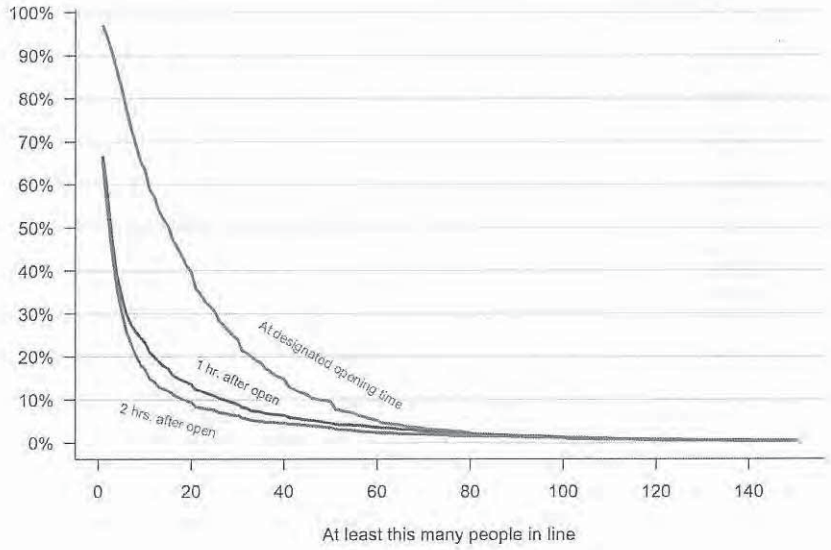
In 2018, there was a notable surge in longest lines around the period between nine and 12 hours after poll openings. (This surge did not occur in 2016.) This time generally corresponds with the late-afternoon/end-of-work-day period. (For example, if polls open at 6 a.m., then the period between nine and 12 hours later would be from 3 p.m. to 6 p.m.) Overall, 17.5% of precincts experienced their longest lines at this time. This is in contrast with 2016, when the corresponding figure was approximately 1%.

This difference could be a result of the sample of precincts being slightly different in 2018 than in 2016. While this is a real possibility, it is more likely that midterm voters (such as in 2018) tend to be different from on-year voters (such as 2016).

5. **Although lines tend to be the longest at the beginning of the day, they dissipate quickly in most precincts.**

Although lines tend to be the longest at the beginning of the day, most precincts managed to reduce the length of their lines quickly. Figure 13 shows the percentage of the Election Day precincts in which the line at Hour 0, Hour 1, or Hour 2 was of a certain length. The percentage of precincts with any given line length decreased with each passing hour. For example, 7.5% of precincts had more than 50 people in line when they opened, but within one hour, that number had dropped to 4.3%, falling to 3.2% within two hours. Similarly, while

Figure 13: Percentage of precincts with at least a certain number of people in line early in the day



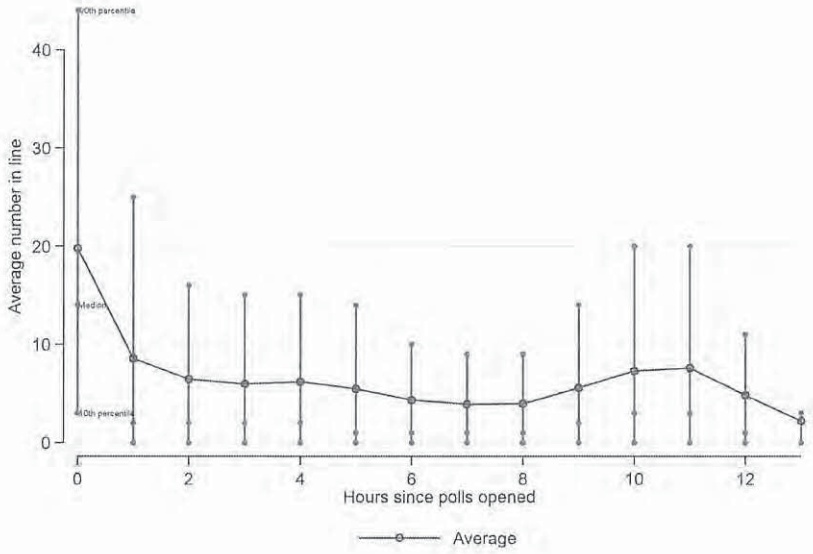
Source: BPC/MIT[46]

only about 34.6% of precincts had fewer than 10 people in line at the beginning, 82.8% had lines of fewer than 10 people within two hours.

Comparing these results with the BPC/MIT report from 2016, there are two important patterns. First, the length of lines when the polls opened was not appreciably shorter in 2018 than in 2016. Second, these opening lines dissipated much more quickly in 2018, which was a major reason overall wait times in 2018 remained less than in 2016.

Given the results reported thus far, it should not be surprising that average lines on Election Day tended to drop as the day progressed. Figure 14, which displays a graph of average line lengths for each hour of the day, illustrates this. In addition, Figure 14 shows the hourly median and the 10th and 90th percentiles. As before, the chart accounts for the fact that polls open at different times by calling the opening hour "Hour 0," the end of the first hour "Hour 1," etc. (For instance, in a state where the polls open at 7 a.m., Hour 0 is 7 a.m., Hour 1 is 8 a.m., etc.)

Figure 14: Average number of people in line each hour after polls open



Source: BPC/MIT[47]

Consistent with the data reported above, the average precinct saw 20 people in line when the doors opened on Election Day 2018. By the end of the first hour, that number had been more than cut in half, to 8.6. Even though there was a small surge toward the end of the day, the average in any hour was never as great as it was in the first hour of voting.

The data plotted in Figure 14 that show the variability of line lengths each hour help to round out the picture. Note that the median and mean at opening time are relatively close (median = 14 and mean = 20), which indicates that line lengths across precincts in the study occurred fairly symmetrically. Even by the end of the first hour, the median (2) is quite far from the mean (8.6). Also note that the 90th percentile value at the end of the first hour (25) is far above the mean. This pattern holds from Hours 1 to 13. Statistically, this shows that a small number of outlier precincts with exceptionally long lines heavily influence the average line length after the first hour. The typical precinct has only a handful of people waiting to check in—the median is no more than three people in line after the opening. Finally, it is notable that the variance of line lengths increases dramatically between Hours 9 and 11. Again, because the mean and median are not affected much, this shows that extraordinarily long lines to vote in the hours after work are rare, even if they are troubling.

6. **If a precinct clears its morning line quickly, it is unlikely to experience long wait times for the rest of the day. If the morning line persists, long wait times are likely to occur for the entire day.**

There is a crush of morning voting on Election Day. The BPC/MIT Polling Place Line Study shows the importance of clearing that morning line. A high volume of voters at the start of the day—both those waiting when the polls open and those coming soon after they open—will lead to lines at most precincts. However, most of those precincts showed the ability to clear those lines within the first couple of hours of voting, never to experience them again for the rest of the day. Conversely, the precincts that could not clear their morning lines after a couple of hours were highly likely to see long lines and long wait times until they closed their doors, often hours after the official polling place closing time.

Do long lines early in the day make a precinct more likely to be burdened by long lines after 5 p.m.? Does having a long line right now mean that a precinct is likely to have one in two or six hours?

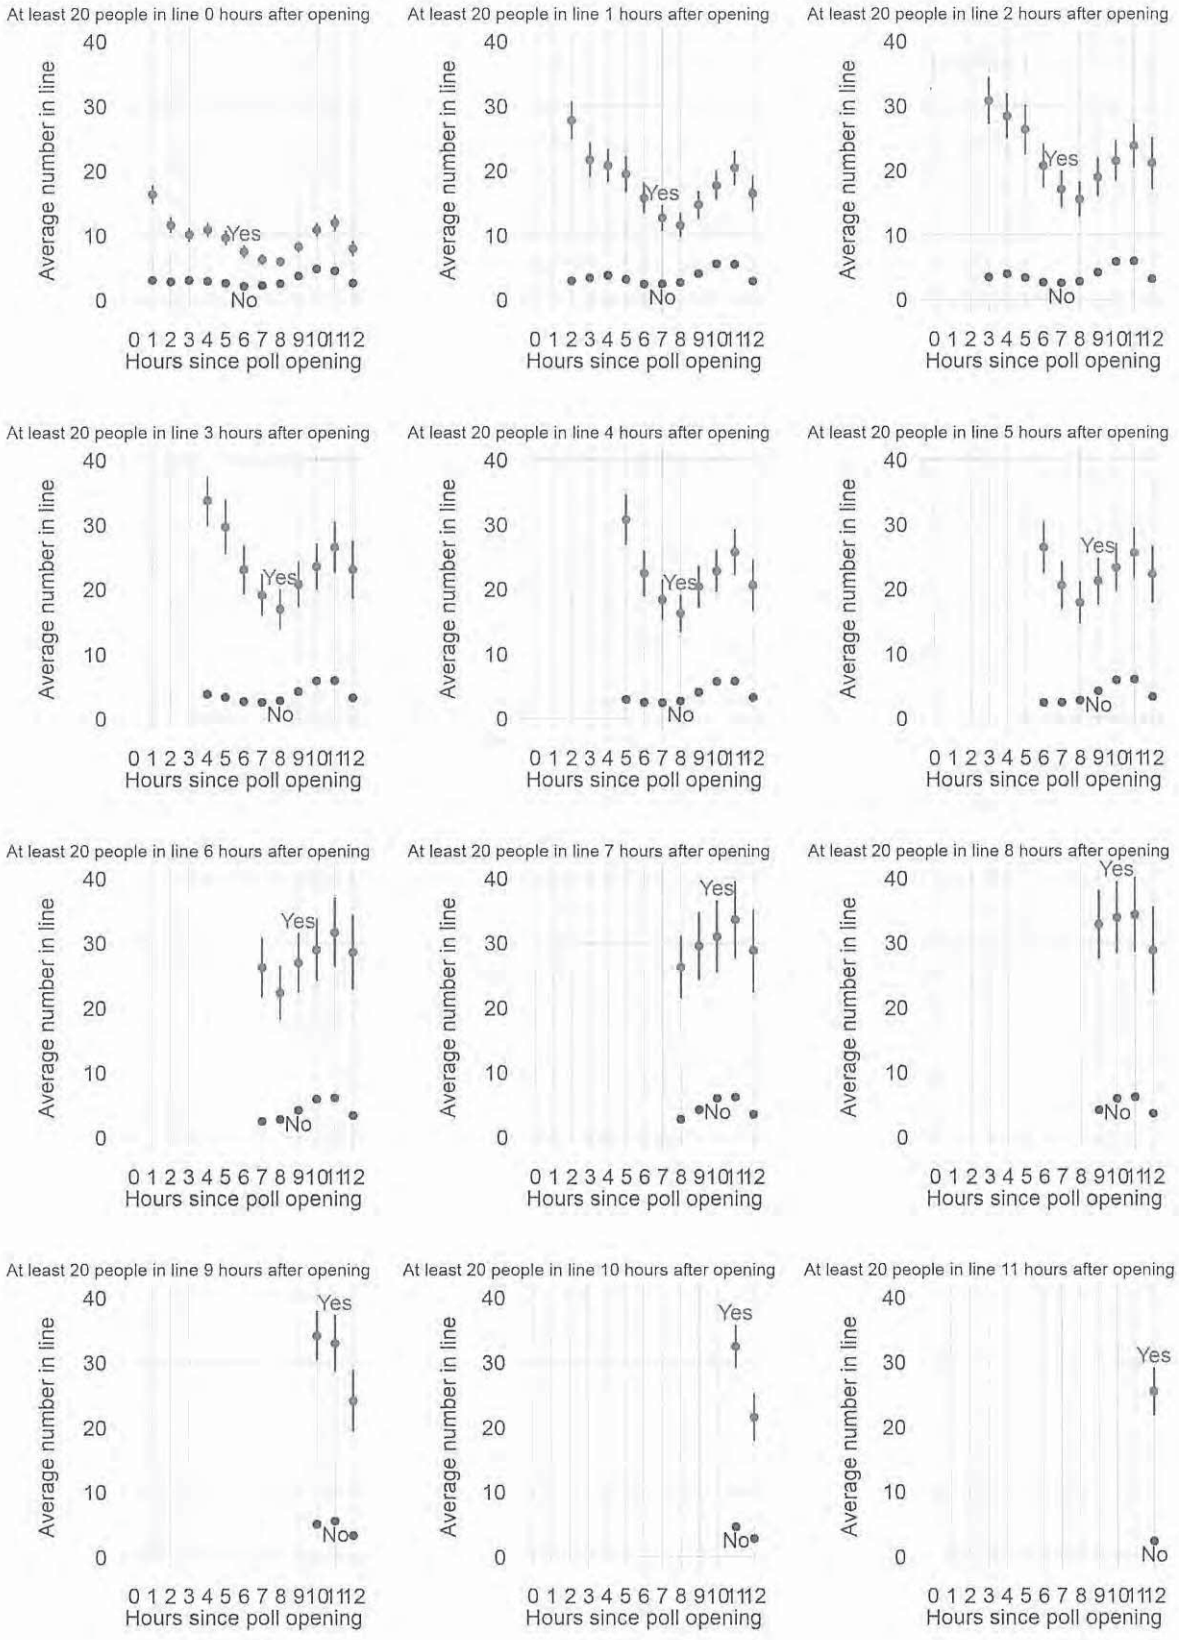
Overall, the data suggest that the answers to these questions are no to the first and yes to the second. While precincts that have long lines right when the polls open are slightly more likely to have long lines later in the day, most precincts with long lines at the opening see those lines recede fairly quickly. However, as the day progresses, if a precinct has a long line later in the morning or in the afternoon, it is unlikely the lines will shorten appreciably until closing time.

The graphs in Figure 15 illustrate these points. This figure has 12 graphs. Each graph shows the average number of people in line later in the day, broken down by whether there were 20 or more people in line at that hour or less than 20 people in line. For instance, the very first graph charts the average number of people in line each hour for the rest of the day, for precincts that had 20 or more people in line when the polls opened ("Yes") and for precincts that had fewer than 20 in line ("No"). In these precincts, if there were at least 20 people in line when the polls were open, there are an average of 16.4 in line at the end of Hour 1, 11.6 in line at the end of Hour 2, etc. In contrast, if there were fewer than 20 people in line when the polls opened, there was an average of 3.1 and 2.8 in line at the end of Hours 1 and 2, respectively.

Scanning across all the graphs, notice that the circles in red climb from one graph to the next. This shows that as the day progresses, having 20 or more people in line at any moment portends longer and longer lines down the road. For instance, in precincts that have more than 20 people in line when the polls open, the average line length at the end of Hour 4 is 10.8 people. However, in precincts that have more than 20 people in line at the end of Hour 1, the average number of people in line at the end of Hour 4 rises to 20.8. If there are still more than 20 people in line at the end of Hour 2, the average number in line at the end of Hour 4 rises again to 28.4.

This shows how precincts very quickly diverge in the morning according to two paths: those that can get the lines under control within an hour or two and those that cannot.

Figure 15: How the number in line now predicts the number in line the rest of the day



Source: BPC/MIT[48]

Conclusion

After two national iterations of the BPC/MIT Polling Place Line Study, it's clear that long lines most fundamentally form when there is a misallocation of resources necessary to handle the service requirement of a polling place. In other words, there aren't enough poll books, voting booths, ballots, or machines to handle the crowd.

What's more:

1. Lines at polling places can be studied—and brought under control—by using approaches and tools that businesses have been employing for decades.
2. To effectively manage polling places and reduce lines, election officials must collect information about the number of people in line on a regular basis at every polling place in their jurisdiction.
3. Best-practice management techniques and policies that encourage a smooth flow of voters in polling places can reduce long lines.
4. Long lines are not the norm for most voters, but at a substantial fraction of polling places, voters wait longer than the 30-minute maximum, and at a smaller but still troubling group of polling places, lines can stretch for over one hour.
5. Whether it's issues that are unique to a polling place or more general problems relating to chronic capacity shortages, both can cause long lines.
6. Lines are longest on the morning of Election Day.
7. Longer lines are correlated with precincts unable to handle early morning lines and precincts that are more urban, denser, and have higher minority populations.

20 The correlation between the two variables shown in Figure 2 is r = 0.43.

21 The line of best fit uses the linear regression statistical technique.

28 A "stable system" is one in which average values of the critical elements of the queue—the arrival rate and the amount of time a customer spends in the system—do not trend upward or downward but remain steady across time.

29 MIT-Caltech Voting Technology Project, *VTP Toolkit*. Available at: http://web.mit.edu/vtp/.

30 In the case of voting, polls reach a utilization limit when the number of people who arrive in a period of time (like an hour) exceeds the number of people who can be served during that period. In the example here, the utilization limit is 60 people per hour, because the polling place can only check in 60 people per hour. If more than 60 people arrive per hour, the line must keep growing until arrivals stop. Even when slightly fewer than 60 people arrive per hour, the wait time will be long, because of the variability in when people arrive. However, the line will eventually stabilize, unlike the situation where the arrival rate exceeds the utilization limit.

31 At the risk of immodesty, the BPC/MIT Polling Place Line Study has had a special relationship with Virginia since 2015, in terms of helping to apply the principles of queuing theory to managing polling place resources. Part of that relationship involved providing many Virginia counties with feedback concerning the match between turnout and polling place resources in anticipation of the 2016 election. It is likely that this additional attention to planning played a role in helping Virginia cope with the 2018 turnout surge.

32 Voter registration and turnout statistics come from: U.S. Election Assistance Commission, Election Administration and Voting Survey, 2018. Available at: https://www.eac.gov/research-and-data/election-administration-voting-survey/.

33 BPC/MIT Polling Place Line Study.

34 Because poll workers generally recorded line lengths at the top of each hour, it is likely that some precincts in this study that recorded never having a line of more than 10 people in fact had a longer line at some other time in the hour. However, because line lengths are "sticky" over short periods of time, it is likely that the number of precincts in the study that had *unrecorded* lines of greater than 10 people is relatively small.

35 BPC/MIT Polling Place Line Study.

36 Ibid.

37 Ibid.

38 In the one peer-reviewed journal article that deeply explored the racial divide in wait times, Pettigrew shows that "election officials appear to systematically provide more poll workers and voting machines to white precincts than minority ones." Stephen Pettigrew, "The Racial Gap in Wait Times: Why Minority Precincts Are Underserved by Local Election Officials," *Political Science Quarterly*, 132(2): 528, 2017. To be clear, however, BPC and MIT did not gather data about precinct-level resource allocation among the precincts in this study and therefore cannot directly address the resource-allocation hypothesis in these jurisdictions.

39 BPC/MIT Polling Place Line Study.

40 A multiple regression framework simultaneously explores demographic factors.

The Bipartisan Policy Center (BPC) is a Washington, D.C.-based think tank that actively fosters bipartisanship by combining the best ideas from both parties to promote health, security, and opportunity for all Americans. Our policy solutions are the product of informed deliberations by former elected and appointed officials, business and labor leaders, and academics and advocates who represent both ends of the political spectrum.

BPC prioritizes one thing above all else: getting things done.

CURRICULUM VITAE

Name: Stephen C. Graves
Department: Sloan School of Management
Date of Birth: November 1951
Place of Birth: Pittsfield, MA
Citizenship: U.S.
Marital Status: Married

Education:

School	Degree	Date
Dartmouth College	A.B.	1973
Dartmouth College	M.B.A.	1974
University of Rochester	M.S.	1976
University of Rochester	Ph.D.	1977

Title of Doctoral Thesis: The Multiproduct Production Cycling Problem for Stochastic Demand and Finite Production Capacity

Principal Fields of Interest: Operations Management, Applied Operations Research

Name and Rank of Other SSM Faculty in Same Field:

Gabriel R. Bitran	Professor
Joann de Zegher	Assistant Professor
Steven D. Eppinger	Professor
Vivek Farias	Professor
Charles H. Fine	Professor
Negin Golrezaei	Assistant Professor
Jonas Jonasson	Assistant Professor
Retsef Levi	Professor
Georgia Perakis	Professor
Thomas Roemer	Senior Lecturer
Zeynep Ton	Adjunct Professor
Nikolaos Trichakis	Associate Professor
Tauhid Zaman	Associate Professor
Yanchong Karen Zheng	Associate Professor

Non-M.I.T. Experience:

Employer	Position	Date
Educational Testing Service	Management Science Analyst	Summer 1972
Simonds Saw and Steel	Management Science Analyst	Summer 1973
University of Rochester	Research Assistant	Summer 1974
University of Rochester	Instructor	Summers 75-77
University of Rochester	Visiting Research Associate	Summers 79-80
Eastman Kodak	Management Science Analyst	Summers 80-81
Shanghai Institute of Mechanical Engineering	Visiting Professor	July 82-Jan 83
Optiant	Member of Advisory Board	2000 - 2009
Servigistics	Chief Scientist	2001 – 2004
JDA	Chief Science Advisor	2005 - 2011

History of M.I.T. Appointments:

Rank	Beginning	Ending
Assistant Professor, Sloan School of Management	7/77	6/81
Associate Professor, Sloan School of Management	7/81	6/87
Professor, Sloan School of Management	7/87	
Leaders for Manufacturing Professor	7/88	6/93
Deputy Dean	9/90	8/93
Abraham J. Siegel Professor of Management	10/95	
Professor, Engineering Systems Division (joint)	7/99	6/15
Professor, Mechanical Engineering Department (joint)	7/05	
Interim Director, Engineering Systems Division	9/12	12/13

Industrial Consulting Record:

Firm and Dates

Bausch and Lomb, 1976; Shycon Associates, 1980 - 1986; GTE Research Laboratories, 1981 - 1982, 1984, 1986; Illinois Central Gulf Railroad, 1982; C.S. Draper Laboratory, 1982 - 1984; ROLM Corporation, 1984, 1993; Palladian Software, 1986; GM Research Laboratories, 1986 – 1997, 2003 - 2004; W.R. Grace, 1987, 1991; Millipore, 1988; WearGuard, 1988; Alcoa, 1993 – 1994; Amazon.Com, 2001; Invistics, 2002 – 2005; Servigistics, 2001 – 2003; JDA, 2003 – 2011; Honeywell, 2003; FormFactor 2006; McMaster-Carr 2007; Sears Holdings, 2015; New York City, 2017; State of Michigan, 2017; Oniqua 2018.

Institute Activities:

Staff Member of Operations Research Center, 1977 - present
Undergraduate Advisor, 1978 - present
Freshman Advisor, 1991- 1998, 2002 - 2005, 2008 - present
Member of Sloan Program Committees: 1978 – 2013 (SB); 1978-1980 (SM); 1985-1987, 1994 – 1998, 2005 - 2008 (PhD).
Chair of Sloan Undergraduate Education Committee, 2010 - 2013
Member of Committee on Academic Performance, 1984-1986
Member of Committee on Discipline, 1995 – 1997
Chair of Committee on Discipline, 1997 – 2001
Member of Sloan Dean Search Committee, 1987
Member of Freshman Housing Committee, 1989
Acting CoDirector, Leaders for Manufacturing Program, 1989-1990
Chair of Parking and Transportation Committee, 1989-1995
Member of Parking and Transportation Committee, 2016 - 2019
CoDirector, Leaders for Manufacturing Program, 1994 - 2001
CoDirector, System Design and Management Program, 1999 - 2001
Chair of Task Force on ROTC, 1995 – 1996
Chair of Sloan Dean Search Committee, 1998
Chair of MIT Faculty, 2001 – 2003
Chair of Faculty Policy Committee, 2001 – 2003

Member of Task Force on Campus Security, 2001
Member, ad hoc committee on Access to and Disclosure of Scientific Information, 2002
Chair, review committee on Faculty Newsletter, 2002
Faculty Newsletter, Editorial Board, 2003 – 2009
Member of Faculty Advisory Committee for MIT Presidential Search, 2004 - 2005
Member of Committee on Undergraduate Admissions and Financial Aid, 2004 – 2006
Chair of Committee on Undergraduate Admissions and Financial Aid, 2007 – 2008
Member of ad hoc committee on MIT Disciplinary System, 2005
Member of ad hoc committee on MLK Visiting Professor Program, 2006
Member of Stellar faculty advisory committee, 2004 – 2010
Chair of Search Committee for Dean of Graduate Student Office, 2007
Chair of Dean for Graduate Education Search Advisory Committee, 2010
Chair of Committee on Graduate Policy, 2008 – 2011
Member of Commencement Committee, 2007 – 2011, 2018 – 2019
Member of Search Committee for Director of Student Financial Services, 2008- 2009
Chair of Search Committee for Director of Financial Aid, 2009 – 2010
Member of MIT150 Steering Committee, 2008 – 2011
Chair of ad hoc committee: Strategic Review of MIT Sloan's Undergraduate Programs, 2009
Member of Education Working Group of the MIT Planning Task Force, 2009
Member of NGS3 faculty advisory group, 2009- 2011
Member of Independent Activities Period (IAP) Subcommittee of the FPC, 2012
Member of Committee on the Undergraduate Program, 2011 – 2013
Chair of Committee on the Undergraduate Program, 2013 - 2014
Co-chair of Task Force for Graduate Student Professional Development, 2012 – 2013
Member of ROTC Oversight Committee, 2012-2014
Member of Employee Assistance Program (EAP) Advisory Committee, 2015 - 2019
Member of ad hoc Group on the Future of Libraries, 2015 – 2016
Member of Committee on Campus Planning, 2016 – 2017
Chair of Committee on Campus Planning, 2017 - 2018
Member of Committee on Community Giving, 2016 – 2019
Member of ad hoc Committee of Graduate Housing, 2017 – 2018
Member of DAPER Advisory Board, 2017 – 2019
Graduate Officer, IDSS, 2017 - 2019
Member of Educational Effectiveness planning group, MIT Accreditation, 2018 – 2019
Member of Committee on Student Life, 2018 - 2020

Professional Activities:

Associate Editor - *Operations Research,* 1981-1986; *Management Science*, 1983-1986, 2001 - 2003; *Manufacturing & Service Operations Management*, 1997 – 2008, 2015 - 2017
Department Editor - *Management Science*, 1987-1991
Area Editor – *Operations Research*, 2006 – 2008
Editor - *Manufacturing & Service Operations Management*, 2009 - 2014
Functional Area Editor - *Interfaces*, 1985-1986
Editor, Edelman Special Issue, *Interfaces*, 1989 - 2007
Member - INFORMS
Member of Student Affairs Committee for ORSA, 1980-1983
Edelman Award Committee, 1988 – 2007; 2011 & 2012 (Chair)
INFORMS (formerly TIMS/ORSA) Publication Committee, 1990-1998, 2006 - 2008
Vice President, Publications - INFORMS, 1994 – 1995

Awards:

Fellow of the Manufacturing and Service Operations Management Society
Fellow of the Production and Operations Management Society
INFORMS Fellow
1999 Billard Award for service at MIT
2012 MSOM Distinguished Service Award
Zaragoza Logistics Center: Medal of Distinction (2013)
INFORMS Case Competition, First Prize (2005)
M&SOM Best Paper Award (2017)
Member of National Academy of Engineering

Subjects Taught:

15.062	Decision Models for Management
15.761	Operations Management
15.763	Practice of Operations Management
15.764	Theory of Operations Management
15.053	Introduction to Management Science
15.770J	Transportation and Logistics Analysis
15.066J	System Optimization and Analysis for Manufacturing
15.762	Operations Management: Models and Applications
15.762J	Supply Chain Planning
15.763J	Manufacturing Systems and Supply Chain Design
15.A03	Operations Research Can be Fun (freshmen seminar)
EC.733J	D Lab Supply Chains (15.772J)
15.762x	Supply Chains for Manufacturing I (MITx)
15.763x	Supply Chains for Manufacturing II (MITx)

Publications:

Books

1. Handbook in Operations Research and Management Science, Volume 4: Logistics of Production and Inventory, edited by S. C. Graves, A. H. G. Rinnooy Kan and P. H. Zipkin, North-Holland, Amsterdam, 1993.

2. Handbook in Operations Research and Management Science, Volume 11: Supply Chain Management: Design, Coordination and Operation, edited by A. G. De Kok and S. C. Graves, Elsevier, Amsterdam, 2003.

Papers

3. Optimal Storage Assignment in Automatic Warehousing Systems, (with W.H. Hausman and L.B. Schwarz), *Management Science*, February 1976, Vol. 22, 629-638.

4. Single Cycle Continuous Review Policies for Arborescent Production/Inventory Systems, (with L.B. Schwarz), *Management Science*, January 1977, Vol. 23, 529-540.

5. Storage-Retrieval Interleaving in Automatic Warehousing Systems, (with W.H. Hausman and L.B. Schwarz), *Management Science*, May 1977, Vol. 23, 935-945.

6. A Note on 'Critical Ratio Scheduling: An Experimental Analysis', *Management Science*, August 1977, Vol. 23, 1358-1359.

7. On 'Production Runs for Multiple Products: The Two-Product Heuristic', (with R.W. Haessler), *Management Science*, July 1978, Vol. 24, 1194-1196.

8. Scheduling Policies for Automatic Warehousing Systems: Simulation Results, (with W.H. Hausman and L.B. Schwarz), *AIIE Transactions,* September 1978, Vol. 10, 260-270.

9. A Note on the Deterministic Demand Multi-Product Single-Machine Lot Scheduling Problem, *Management Science*, March 1979, Vol. 25, 276-280.

10. A Methodology for Studying the Dynamics of Extended Logistics Systems, (with J. Keilson), *Naval Research Logistics Quarterly,* July 1979, Vol. 26, 169-197.

11. An n-Constraint Formulation of the (Time Dependent) Traveling Salesman Problem, (with K.R. Fox and B. Gavish), *Operations Research*, July-August 1980, Vol. 28, 1018-1021.

12. The Multi-Product Production Cycling Problem, *AIIE Transactions*, September 1980, Vol. 12, 233-240.

13. A One-Product Production/Inventory Problem with Continuous Review Policy, (with B. Gavish), *Operations Research,* September-October 1980, Vol. 28, 1228-1236.

14. Production/Inventory Systems with a Stochastic Production Rate Under a Continuous Review Policy, (with B. Gavish), *Computers and Operations Research,* 1981, Vol. 8, 169-183.

15. Multistage Lot-Sizing: An Iterative Procedure, in TIMS Studies in Management Science, *Multi-Level Production/Inventory Systems: Theory and Practice*, edited by L.B. Schwarz, 1981, Vol. 16, 95-109.

16. The Compensation Method Applied to a One-Product Production Inventory Model, (with J. Keilson), *Mathematics of Operations Research*, May 1981, Vol. 6, 246-262.

17. A Review of Production Scheduling, *Operations Research*, July-August 1981, Vol. 29, 646-675.

18. Problem Formulations and Numerical Analysis in Integer Programming and Combinatorial Optimization, (with J.F. Shapiro), in *Mathematical Programming with Data Perturbations I*, edited by A.V. Fiacco, 1982, 131-148.

19. Using Lagrangean Techniques to Solve Hierarchical Production Planning Problems, *Management Science*, March 1982, Vol. 28, 260-275.

20. The Application of Queueing Theory to Continuous Perishable Inventory Systems, *Management Science*, April 1982, Vol. 28, 400-406.

21. A Multiple-Item Inventory Model with a Job Completion Criterion, *Management Science*, November 1982, Vol. 28, 1134-1137.

22. System Balance for Extended Logistic Systems, (with J. Keilson), *Operations Research*, March-April 1983, Vol. 31, 234-252.

23. An Integer Programming Procedure for Assembly System Design Problem, (with B. Lamar), *Operations Research*, May-June 1983, Vol. 31, 522-545.

24. Scheduling of Re-entrant Flow Shops, (with H.C. Meal, D. Stefek, and A.H. Zeghmi), *Journal of Operations Management,* August 1983, Vol. 3, 197-207.

25. A Simple Stochastic Model for Facility Planning in a Mental Health Care System, (with H.S. Leff, J. Natkins, and M. Senger), *Interfaces*, October 1983, Vol. 13, 101-110.

26. Deep-Draft Dredging of U.S. Coal Ports: A Cost-Benefit Analysis, (with M. Horwitch and E.H. Bowman), *Policy Sciences*, Vol. 17, 1984.

27. A Study of Production Smoothing in a Job Shop Environment, (with A.B. Cruickshanks and R.D. Drescher), *Management Science*, March 1984, Vol. 30, 368-380.

28. A Minimum Concave-Cost Dynamic Network Flow Problem with an Application to Lot-Sizing, (with J.B. Orlin), *Networks*, Vol. 15, 1985.

29. Description and Field Test of a Mental Health System Resource Allocation Model, (with H.S. Leff, J. Natkins, and J. Bryan), *Administration in Mental Health*, Fall 1985, Vol. 13, 43-68.

30. Continuous-Review Policies for a Multi-Echelon Inventory Problem with Stochastic Demand, (with M. DeBodt), *Management Science*, October 1985, Vol. 31, 1286-1299.

31. A Multi-Echelon Inventory Model for a Repairable Item with One-for-One Replenishment, *Management Science*, October 1985, Vol. 31, 1247-1256.

32. An LP Planning Model for a Mental Health Community Support System, (with H.S. Leff and M. Dada), *Management Science*, February 1986, Vol. 32, 139-155.

33. Overlapping Operations in Material Requirements Planning, (with M.M. Kostreva) *Journal of Operations Management,* Vol. 6, No. 3, May 1986, 283-294.

34. Two-Stage Production Planning in a Dynamic Environment, (with H.C. Meal, S. Dasu, Y. Qiu), in Lecture Notes in Economics and Mathematical Systems, *Multi-Stage Production Planning and Inventory Control,* edited by S. Axsater, Ch. Schneeweiss, and E. Silver, Springer-Verlag, Berlin, 1986, Vol. 266, 9-43.

35. A Tactical Planning Model for a Job Shop, *Operations Research*, July-August 1986, Vol. 34, 522-533.

36. Equipment Selection and Task Assignment for Multiproduct Assembly System Design, (with C.A. Holmes Redfield) *International Journal of Flexible Manufacturing Systems,* 1988, Vol. 1, No. 1, pp. 31-50.

37. Safety Stocks in Manufacturing Systems, *Journal of Manufacturing and Operations Management,* 1988, Vol. 1, No. 1, pp. 67-101.

38. Determining the Spares and Staffing Level for a Repair Depot, *Journal of Manufacturing and Operations Management,* 1988, Vol. 1, No. 2, pp. 227-241.

39. A Composite Algorithm for the Concave-Cost Network Flow Problem, (with A. Balakrishnan) *Networks*, Vol. 19, 1989, pp. 175-202.

40. A Tactical Planning Model for Manufacturing Subcomponents of Mainframe Computers, (with C. Fine), *Journal of Manufacturing and Operations Management,* 1989, Vol. 2, No. 1, pp. 4-34.

41. A Model for the Configuration of Incoming WATS Lines, (with R. H. Blake and P. C. Santos), *Queueing Systems*, 1990, Vol. 7, No. 1, pp. 3-21.

42. Principles on the Benefits of Manufacturing Process Flexibility, (with W. C. Jordan), *Management Science*, April 1995, Vol. 41, No. 4, pp. 577 - 594.

43. A Multi-Echelon Inventory Model with Fixed Replenishment Intervals, *Management Science*, January 1996, Vol. 42, No. 1, pp. 1-18.

44. Cyclic Scheduling in a Stochastic Environment, (with H. Zhang), *Operations Research*, November-December 1997, Vol. 45, No. 6, pp. 894-903.

45. A Dynamic Model for Requirements Planning with Application to Supply Chain Optimization, (with D. B. Kletter and W. B. Hetzel) *Operations Research*, May-June 1998, Vol. 46, Supp. No. 3, pp. S35-S49.

46. OMAC: A System for Operations Modeling and Analysis, (with K. N. McKay and D. B. Kletter), *Annals of OR*, Vol. 72, 1997, pp. 241-264.

47. Reducing Flow Time in Aircraft Manufacturing, (with Jackson Chao), *Production and Operations Management*, Spring 1998, Vol. 7, No. 1, pp. 38-52.

48. A Single-Item Inventory Model for a Non-Stationary Demand Process, *Manufacturing & Service Operations Management*, 1999, Vol. 1, No. 1, pp. 50-61.

49. Optimizing Strategic Safety Stock Placement in Supply Chains, (with S. P. Willems), *Manufacturing & Service Operations Management*, 2000, Vol. 2, No. 1, pp. 68 – 83.

50. Manufacturing Planning and Control, in Handbook of Applied Optimization, edited by P. Pardalos and M. Resende, Oxford University Press, New York, 2002, pp. 728 - 746.

51. Technology Portfolio Management: Optimizing Interdependent Projects over Multiple Time Periods, (with M. Dickinson and A. Thornton), *IEEE Transactions on Engineering Management*, Vol. 48, No. 4, November 2001, pp. 518-527.

52. Creating an Inventory Hedge for Markov-Modulated Poisson Demand: Application and Model, (with H. S. Abhyankar), *Manufacturing & Service Operations Management*, Fall 2001, Vol. 3, No. 4, pp. 306 - 320.

53. Process Flexibility in Supply Chains, (with B. T. Tomlin), *Management Science*, July 2003, Volume 49, Number 7, pp. 907 - 919.

54. Supply Chain Design: Safety Stock Placement and Supply Chain Configuration, (with S. Willems), Chapter 3 in Handbook in Operations Research and Management Science, Volume 11: Supply Chain Management: Design, Coordination and Operation,, edited by A. G. De Kok and S. C. Graves, Elsevier, Amsterdam, 2003, pp. 95 - 132.

55. Optimizing the Supply-Chain Configuration for New Products, (with S. Willems), *Management Science*, August 2005, Vol. 51, No. 8, pp. 1165 – 1180.

56. Logistics Network Design with Supplier Consolidation Hubs and Multiple Shipment Options, (with M.L.F. Cheong, R. Bhatnagar), *Journal of Industrial and Management Optimization*, Volume 3, Number 1, February 2007, pp. 51–69.

57. A Single-Product Inventory Model for Multiple Demand Classes, (with H. Arslan, T. Roemer) *Management Science*, September 2007, Vol. 53, No. 9, pp. 1486 – 1500.

58. Flexibility Principles, Chapter 3 in Building Intuition: Insights from Basic Operations Management Models and Principles, edited by D. Chhajed and T. J. Lowe, Springer Science+Business Media, LLC, New York, 2008, pp. 33 – 49.

59. Little's Law, (with J. D. C. Little), Chapter 5 in Building Intuition: Insights from Basic Operations Management Models and Principles, edited by D. Chhajed and T. J. Lowe, Springer Science+Business Media, LLC, New York, 2008, pp. 81 – 100.

60. Strategic Inventory Placement in Supply Chains: Non-Stationary Demand, (with S. Willems) *Manufacturing & Service Operations Management*, Spring 2008, Vol. 10, No. 2, pp. 278 – 287.

61. The Benefits of Re-Evaluating Real-Time Order Fulfillment Decisions, (with P. Xu and R. Allgor), *Manufacturing & Service Operations Management,* Spring 2009, Vol. 11, No. 2, pp 340-355.

62. Strategic Safety Stocks in Supply Chains with Evolving Forecasts, (with Tor Schoenmeyr) *Manufacturing & Service Operations Management,* Fall 2009, Vol. 11, No. 4, pp 657-673.

63. Optimal Planning Quantities for Product Transition, (with Hongmin Li and Donald Rosenfield), *Production and Operations Management*, March-April 2010, Vol. 19, No. 2, pp 142 – 155.

64. Uncertainty and Production Planning, in Production and Inventories in the Extended Enterprise , edited by Karl G. Kempf, Pınar Keskinocak, and Reha Uzsoy, *International Series in Operations Research & Management Science* Volume 151, Springer US, 2011, pp 83 – 101.

65. Setting Planned Lead Times for a Make-To-Order Production System under Master Schedule Smoothing, (with C. C. Teo and R. Bhatnagar), *IIE Transaction*, 2011, Vol. 43, No. 6, pp. 399-414.

66. How to Catch a Tiger: Understanding Putting Performance on the PGA Tour, (with Douglas Fearing and Jason Acimovic), *Journal of Quantitative Analysis in Sports*, 2011, Vol. 7: Issue 1, Article 5. DOI: 10.2202/1559-0410.1268.

67. Pricing Decisions during Inter-generational Product Transitions, (with Hongmin Li) *Production and Operations Management*, January-February 2012, Vol. 21, No. 1, pp 14-28.

68. Remanufacturing and Energy Savings, (with T. Gutowski, S. Sahni, and A. Boustani), *Environmental Science & Technology*, 2011, Vol. 45, pp. 4540-4547.

69. An Application of Master Schedule Smoothing and Planned Lead Time Control, (with C. C. Teo and R. Bhatnagar), *Production and Operations Management,* March-April 2012, Vol. 21, No. 2, pp 211 - 223.

70. Ship-Pack Optimization in a Two-Echelon Distribution System, (with Naijun Wen and Justin Ren), *European Journal of Operational Research*, August 2012, Vol. 220, Issue 3, pp. 777-785.

71. Optimal Capacity Conversion for Product Transitions under High Service Requirements, (with Hongmin Li and Woonghee Tim Huh), *Manufacturing & Service Operations Management*, Winter 2014, Vol. 16, No. 1, pp. 46-60.

72. A Forecast-driven Tactical Planning Model for a Serial Manufacturing Systems, (with Pallav Chhaochhria) *International Journal of Production Research*, December 2013, 51:23-24, pp. 6860-6879.

73. Water Desalination Supply Chain Modeling and Optimization: The Case of Saudi Arabia, (with Malak T. Al-Nory) *IDA Journal of Desalination and Water Reuse,* Vol. 5, No. 2 (2013) pp 64 - 74.

74. Supply Chain Design for the Global Expansion of Manufacturing Capacity in Emerging Markets, (with Stefan Weiler, Dayán Páez, Jung-Hoon Chun, Gisela Lanza), *CIRP Journal of Manufacturing Science and Technology*, Vol. 4, No. 3 (265-280), 2011.

75. A Network Flow Approach for Tactical Resource Planning in Outpatient Clinics, (with Thu Ba T. Nguyen, Appa Iyer Sivakumar), *Health Care Management Science*, Vol. 18, No. 2 (2015): pp.124-136.

76. Desalination Supply Chain Decision Analysis and Optimization, (with Malak T. Al-Nory, Alexander Brodsky, Burçin Bozkaya), *Desalination* Vol. 347 (2014), pp. 144-157.

77. Making Better Fulfillment Decisions on the Fly in and Online Retail Environment, (with J. Acimovic), *Manufacturing & Service Operations Management,* Winter 2015, Vol. 17, No. 1, pp 34-51.

78. Setting Optimal Production Lot Sizes and Planned Lead Times in a Job Shop System, (with Rong Yuan), *International Journal of Production Research*, (2016), Vol. 54, Issue 20, pp 6105 - 6120. DOI: 10.1080/00207543.2015.1073859.

79. OM Forum - Practice-Based Research in Operations Management: What It Is, Why Do It, Related Challenges, and How to Overcome Them, (with Jeremie Gallien and Alan Scheller-Wolf) *Manufacturing & Service Operations Management*, Winter 2016, Vol. 18, No. 1, pp 5 - 14. http://dx.doi.org/10.1287/msom.2015.0566

80. Strategic Safety Stock Placement in Supply Chains with Capacity Constraints (with Tor Schoenmeyr) *Manufacturing & Service Operations Management*, Summer 2016, Vol. 18, No. 3, pp 445 - 460. http://dx.doi.org/10.1287/msom.2016.0577.

81. Inventory Management in a Consumer Electronics Closed-Loop Supply Chain, (with Andre Calmon), *Manufacturing & Service Operations Management,* Fall 2017, Vol. 19, No. 4, pp 568 - 585. https://doi.org/10.1287/msom.2017.0622

82. Scheduling Rules to Achieve Lead-time Targets in Outpatient Appointment Systems, (with Thu Ba T. Nguyen, Appa Iyer Sivakumar), *Health Care Management Science*, December 2017, Vol. 20, No. 4, pp 578-589. http://dx.doi.org/10.1007/s10729-016-9374-2.

83. No Magic Bullet: A Theory-based Meta-analysis of Markov Transition Probabilities in Studies of Service Systems for Persons with Serious Mental Illness, (with H. Stephen Leff, Clifton Chow) *Psychiatric Services* (2017), Vol. 68, No. 3, pp 278-287, http://dx.doi.org/10.1176/appi.ps.201500523.

84. Mitigating Spillover in Online Retailing via Replenishment, (with J. Acimovic), *Manufacturing & Service Operations Management*, Summer 2017, Vol. 19, No. 3 pp. 419-436. https://doi.org/10.1287/msom.2016.0614 . Available at https://ssrn.com/abstract=2459097.

85. Stowage Decisions in Multi-zone Storage Systems, (with Rong Yuan and Tolga Cezik), *International Journal of Production Research* (2018) Vol. 56, No. 1-2, pp 333-343. https://doi.org/10.1080/00207543.2017.1398428 Available at SSRN: https://ssrn.com/abstract=2990432

86. Performance Evaluation of Material Separation in a Material Recovery Facility using a Network Flow Model, (with Karine Ip, Mariapaola Testa, Anne Raymond and Timothy Gutowski), *Resources, Conservation and Recycling* 131 (2018): 192-205

87. Capacity Planning with Demand Uncertainty for Outpatient Clinics, (with Thu Ba T. Nguyen, Appa Iyer Sivakumar), *European Journal of Operational Research* 267, no. 1 (2018): 338-348.

88. Velocity-based Storage Assignment in Semi-automated Storage Systems, (with Rong Yuan and Tolga Cezik), *Production and Operations Management* (2019), Vol. 28, No. 2, Feb. 2019, pp. 354 – 373. https://doi.org/10.1111/poms.12925 Available at: SSRN: https://ssrn.com/abstract=2889354.

89. Integrated planning for design and production in two-stage recycling operations, (with Jiyoun C. Chang, Randolph E. Kirchain and Elsa A. Olivetti.) *European Journal of Operational Research*, Vol. 273, no. 2 (2019): 535-547. https://doi.org/10.1016/j.ejor.2018.08.022

Proceedings

1. A Mathematical Programming Procedure for Equipment Selection and System Evaluation in Programmable Assembly, (with D.E. Whitney), *Proceedings of the 18th IEEE Conference on Decision and Control,* Fort Lauderdale, Florida, December 1979, 531-536.

2. Extensions to a Tactical Planning Model for a Job Shop, *Proceedings of the 27th IEEE Conference on Decision and Control*, Austin, Texas, December 1988, pp. 1850-1855.

3. Using Simulated Annealing to Select Least-Cost Assembly Sequences, (with J. M. Milner and D. E. Whitney), *Proceedings of IEEE Conference on Robotics and Automation*, May 1994.

4. Spatial Yield Modeling for Semiconductor Wafers, (with A. I. Mirza, G. O' Donoghue, and A. W. Drake), *Proceedings of IEEE/SEMI Advanced Semiconductor Manufacturing Conference*, November 1995

5. Strategic Safety Stock Placement in Supply Chains, (with S. Willems) *Proceedings of the 1996 MSOM Conference*, Dartmouth College, Hanover NH, June 1996, pp. 299 - 304.

6. Optimizing Monsanto's Supply Chain under Uncertain Demand, (with C. Gutierrez, M. Pulwer, H. Sidhu and G. Weihs), *Annual Conference Proceedings - Council of Logistics Management*, Orlando FL, October 1996, pp. 501-516.

7. Optimizing the Supply-Chain Configuration for New Products, (with S. P. Willems), *Proceedings of the 2000 MSOM Conference*, Ann Arbor, MI, 2000, 8 pp.

8. Tactical Shipping and Scheduling at Polaroid with Dual Lead-Times, (with Kermit Threatte), *Proceedings of the 2002 SMA Conference*, Singapore, 2002, 8 pp.

9. A Base Stock Inventory Model for a Remanufacturable Product, *Proceedings of the 2003 SMA Conference*, Singapore, 2003, 7 pp.

10. Optimizing Safety Stock Placement in General Network Supply Chains, (with K. Lesnaia), *Proceedings of the 2004 SMA Conference*, Singapore, 2004, 7 pp.

11. Traditional Inventory Models in an E-Retailing Setting: A Two-Stage Serial System with Space Constraints, (with R. Allgor and P. Xu), *Proceedings of 2004 SMA Conference*, Singapore, 2004, 6 pp.

12. Logistics Network Design with Differentiated Delivery Lead-Time: Benefits and Insights, (with M.L.F. Cheong, and R. Bhatnagar), *Proceedings of 2005 SMA Conference*, Singapore, 20 pp.

13. An Extension to the Tactical Planning Model for a Job Shop: Continuous-Time Control, (with C. C. Teo, and R. Bhatnagar), *Proceedings of 2005 SMA Conference*, Singapore, 8 pp.

14. The Complexity of Safety Stock Placement in General-Network Supply Chains, (with K. Lesnaia, and I. Vasilescu), *Proceedings of the 2005 SMA Conference*, Singapore, 5 pp.

15. The Benefits of Re-Evaluating Real Time Fulfillment Decisions, (with P. Xu and R. Allgor), *Proceedings of 2005 SMA Conference*, Singapore, 7 pp.

16. Performance Analysis of Order Fulfillment for Low Demand Items in E-tailing, (with P. Chhaochhria), *Proceedings of 2007 SMA Conference*, Singapore, 5 pp.

17. Capacity Planning in a General Supply Chain with Multiple Contract Types, (with X. Huang), *Proceedings of 2007 SMA Conference*, Singapore, 6 pp.

18. Reusing Personal Computer Devices – Good or Bad for the Environment?, (with S. Sahni, A. Boustani and T. Gutowski) IEEE/International Symposium on Sustainable Systems and Technology, Washington D.C, 2010

19. Appliance Remanufacturing and Life Cycle Energy and Economic Savings, (with S. Sahni, A. Boustani and T. Gutowski) IEEE/International Symposium on Sustainable Systems and Technology, Washington D.C, 2010.

20. Water Desalination Supply Chain Modeling and Optimization, (with Malak T. Al-Nory), Data Engineering Workshops (ICDEW), 2013 IEEE 29th International Conference, April 2013.

Working Papers and Technical Reports

W1. The Travelling Salesman Problem and Related Problems, (with B. Gavish), Operations Research Center, M.I.T., Working Paper No. 078-78, July 1978, revised and retitled, March 1981.

W2. A Research Agenda for Models to Plan and Schedule Manufacturing Systems, (with C. Abraham, B. Dietrich, W. Maxwell, and C. Yano), Sloan School of Management, M.I.T., Working Paper No. 1689-85, revised July 1985.

W3. Principles on the Benefits of Manufacturing Process Flexibility, (with W. C. Jordan), Sloan School of Management, M.I.T. Working Paper No. 3296-91-MSA, May 1991 (GM Research Laboratories Research Publication GMR-7310).

W4. An Analytic Approach for Demonstrating the Benefits of Limited Flexibility, (with W. C. Jordan), Sloan School of Management, M.I.T. Working Paper No. 3297-91-MSA, May 1991 (GM Research Laboratories Research Publication GMR-7341).

W5. Creating an Inventory Hedge for Markov-Modulated Poisson Demand: Application and Model, (with H. S. Abhyankar), January 2000, long version. (short version published in M&SOM.

W6. Optimizing Strategic Safety Stock Placement in Supply Chains, (with S. Willems), August 1998, long version. (short version published in M&SOM).

W7. Strategic Inventory Placement in Supply Chains: Nonstationary Demand, (with S. Willems), August 2002 working paper (substantially revised version published in M&SOM).

W8. A Constant-Inventory Tactical Planning Model for a Job Shop, (with J. S. Hollywood), working paper, January 2001, revised March 2004, January 2006, 36 pp.

W9. A Dual-Channel Vendor-Buyer System with Minimum Purchase Commitment, with (Y. Wang and R. Bhatnagar), working paper, June 2008, 33 pp.

W10. Capacity Planning in a General Supply Chain with Multiple Contract Types – Single Period Model, (with Xin Huang), June 2008, revised September 2008, 41 pp

W11. Ship-pack Optimization in a Two-echelon Distribution System with Product Obsolescence, (with Elnaz Karimi and Z. Justin Ren). *Available at SSRN 3242756* (2018).

W12. Coordination of Multi-Echelon Supply Chains Using the Guaranteed Service Framework, (with Tor Schoenmeyr). *Available at SSRN 3243806* (2018).

W13. Warranty Matching in a Consumer Electronics Closed-Loop Supply Chain, (with Andre P. Calmon and Stef Lemmens). *Available at SSRN 3357683* (2019).

Teaching Cases

1. Steel Works, Inc, prepared by David Kletter, 1996

2. Meditech Surgical, prepared by Bryan Gilpin, 1995.

3. Apollo Paper Company, prepared by Charles DeWitt, 1995.

4. Use of a Queuing Model to Design a Lean System, prepared by Jamie Flinchbaugh, 2002

5. The Challenge at Instron, prepared by Dan Wheeler, 2000.

6. H. C. Starck, Inc., prepared by Thomas J. Carroll, 2000.

7. Ford Pan-European Durable Containers, prepared by Carmelo Anthony Palumbo, 2002.

8. Reebok NFL Replica Jerseys: A Case for Postponement, prepared by John C. W. Parsons, 2005.

9. American Axle and Manufacturing: Determining the Optimal Number of Bar Lengths for Axle Shaft Production, prepared by Heath Holtz, 2005.

10. Production Planning for Chemical Manufacturing, prepared by Shardul Phadnis, 2007.

Invited Presentations (Partial List up to 1992):

1. "Improved Scheduling for Automatic Warehousing Systems: Simulation Tests," (with W.H. Hausman and L.B. Schwarz), Joint ORSA/TIMS National Meeting, New York, New York, May 1978.

2. "Logistic Failure vs. Mission Failure in Reliability Specifications," (with J. Keilson), Department of Defense Acquisition Research Symposium, Hershey, Pennsylvania, June 1978.

3. "A Methodology for Studying the Dynamics of Extended Logistics Systems," (with J. Keilson), Conference on Multi-Echelon Inventory Systems, George Washington University, November 1978.

4. "Multistage Lot-Sizing: An Iterative Procedure," Joint ORSA/TIMS Meeting, New Orleans, May 1979 (Also Purdue, April 1979).

5. "The Introduction of Feedback into a Hierarchical Production Planning System," TIMS XXIV International Meeting, Honolulu, June 1979.

6. "Production Scheduling: Theory and Practice," TIMS XXIV International Meeting, Honolulu, June 1979.

7. "System Balance for Extended Logistics Systems," (with J. Keilson), Conference on Multi-Echelon Inventory Systems, Philadelphia, Pennsylvania, November 1979.

8. "Base Stock Systems for Multistage Planning," Conference on Multi-Echelon Inventory Systems, Chapel Hill, North Carolina, June 1980.

9. "Optimization-Based Approaches to Vehicle Routing Problems," (with T.L. Magnanti), Joint ORSA/TIMS National Meeting, Colorado Springs, Colorado, November 1980.

10. "A Mathematical Programming Heuristic for Manufacturing System Design and Evaluation," (with B.W. Lamar) CORS/TIMS/ORSA National Meeting, Toronto, May 1981.

11. "The Dynamics of a Multiechelon Inventory System for a Repairable Item," (with J. Keilson), ORSA/TIMS National Meeting, Houston, October 1981.

12. "A Study of Production Smoothing in a Job Shop," (with A.B. Cruickshanks and R.D. Drescher), TIMS/ORSA National Meeting, Detroit, April 1982.

13. "Scheduling of Re-entrant Flow Shops," (with H.C. Meal, D. Stefek, A.H. Zeghmi), TIMS/ORSA National Meeting, Chicago, May 1983.

14. "An LP Planning Model for a Mental Health Community Support System," (with M. Dada and H.S. Leff), ORSA/TIMS National Meeting, Orlando, November 1983.

15. "Operational Analysis of a Job Shop," TIMS/ORSA National Meeting, San Francisco, May 1984.

16. "Two-Stage Production Planning in a Dynamic Environment," (with H.C. Meal), ORSA/TIMS National Meeting, Dallas, November 1984.

17. "Determining the Spares and Staffing Levels for a Repair Depot," TIMS/ORSA National Meeting, Boston, May 1985.

18. "Developing and Use of a Production Flow Plan," ORSA/TIMS National Meeting, Atlanta, November 1985.

19. "Safety Stocks in Manufacturing Systems," ORSA/TIMS National Meeting, Miami, October 1986.

20. "Equipment Selection and Task Assignment for Multiproduct Assembly System Design," (with C.A. Holmes), ORSA/TIMS National Meeting, St. Louis, October 1987.

21. "A Multiechelon Inventory Model for Fixed Reorder Intervals," TIMS/ORSA National Meeting, Washington, DC, April 1988.

22. "Production Planning in a Dynamic Environment," ORSA/TIMS National Meeting, Denver, October 1988. (Also, Yale, November 1988, Carnegie-Mellon, April 1989.)

23. "Cyclic Schedules in Stochastic Environments," CORS/TIMS/ORSA National Meeting, Vancouver, Canada, May 1989.

24. "Production Planning over a Multiplant Operation," ORSA/TIMS National Meeting, Philadelphia, October 1990.

25. "Principles on the Benefits of Manufacturing Flexibility," (with W. C. Jordan), TIMS/ORSA National Meeting, Nashville, May 1991. (Also, University of Minnesota, February 1991, Ohio State, November 1991).

26. "Some Thoughts on Inventory Modeling and Diagnostics," UCLA Conference in Honor of El Buffa, Los Angeles, November 1991.

27. "Reducing Flow Time in Aircraft Manufacturing," (with Jackson Chao), ORSA/TIMS National Meeting, San Francisco, October 1992.

DEFENDANTS' EX. 2

Line Length Data Collection Sheet

(Fulton County, GA)

6 November 2018

Precinct: 01C, 01S

Number of Active Registered Voters: _____

Please use this sheet to record the number of people in line to check in at the indicated times.

- If no one is in line, please enter a zero (0).
- If you are unable to record the line length at a particular time, please enter the number as close as you can to the appointed time. Enter an X if you failed to note the line length at a particular time.

TIME	NUMBER IN LINE	NUMBER OF ACTIVE EXPRESS POLLS	TOTAL VOTERS CHECKED IN
7:00 am*	28	3	
8:00 am	32	3	
9:00 am	26	3	
10:00 am	13	3	
11:00 am	28	3	
12:00 pm	17	3	
1:00 pm	15	3	
2:00 pm	12	3	
3:00 pm	23	3	
4:00 pm	24	3	
5:00 pm	19	3	
6:00 pm	20	3	
7:00 pm	2	3	

At what time did the last voter check in to vote? 0703.

*If the polls opened later than 7:05 am, please indicate when you opened here: N/A.

Please return the completed form in the Envelope labeled "Line Collection Forms."

Thank you!

DEFENDANTS' EX. 3

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF GEORGIA
ATLANTA DIVISION

FAIR FIGHT ACTION, *et al.*

Plaintiffs,

v.

BRAD RAFFENSPERGER, *et al*,

Defendants.

CIVIL ACTION

FILE NO. 1:18-cv-05391-SCJ

Expert Report of Sean P. Trende

I, Sean P. Trende, do hereby declare the following:

1. I am over 18 years of age and am competent to testify regarding the matters discussed in this declaration.

2. My areas of expertise include political history, United States voting laws, redistricting, and the study of campaigns and elections.

3. I have been retained in this matter to provide expert testimony responding to the report of Dr. Stephen C. Graves. All opinions contained in this declaration are offered to a reasonable degree of professional certainty.

4. My *curriculum vitae* is attached to this declaration as **Exhibit 1.**

EXPERT CREDENTIALS

5. I have studied and followed United States elections on both a part-time and full-time basis for almost two decades.

6. I received a B.A. from Yale University in 1995, with a double major in history and political science.

7. I received a J.D. from Duke University in 2001.

8. I also received an M.A. from Duke University in 2001, in political science.

9. I received a Master's in Applied Statistics from The Ohio State University in 2019.

10. I am currently enrolled as a doctoral candidate in political science at The Ohio State University. I have completed all of my coursework and have passed comprehensive examinations in both methods and American Politics.

11. I joined RealClearPolitics in January of 2009. I assumed a fulltime position with RealClearPolitics in March of 2010. My title is Senior Elections Analyst. RealClearPolitics is a company of around 40 employees, with offices in Washington D.C. It produces one of the most heavily trafficked political websites in the world, which serves as a one-stop shop for political analysis from all sides of the political spectrum and is recognized as a pioneer in the field of poll aggregation. It produces original content, including both data analysis and traditional reporting. It is routinely cited by the most influential voices in politics, including David Brooks of *The New York Times*, Brit Hume of *Fox News*, Michael Barone of *The Almanac of American Politics*, Paul Gigot of *The Wall Street Journal*, and Peter Beinart of *The Atlantic*.

12. My main responsibilities with RealClearPolitics consist of tracking, analyzing, and writing about elections. I collaborate in rating the competitiveness of Presidential, Senate, House, and gubernatorial races. As a part of carrying out these responsibilities, I have studied and written

extensively about demographic trends in the country, exit poll data at the state and federal level, public opinion polling, and voter turnout and voting behavior.

13. I am currently the Gerald R. Ford Visiting Scholar at the American Enterprise Institute, where my publications will focus on demographic changes and American elections.

14. I served as a Senior Columnist for Dr. Larry Sabato's "Crystal Ball" from January 2014 through the end of 2016. I had to stop writing for the Crystal Ball because schoolwork was taking up too much of my time.

15. I am the author of *The Lost Majority: Why the Future of Government is up For Grabs and Who Will Take It.* The book offers a revisionist take on realignment theory. It argues that realignments are a poor concept that should be abandoned. As part of this analysis, it conducts a thorough analysis of demographic and political trends beginning around 1920 and continuing through the modern times, and notes the effect that the Democrats' increasingly compact coalition has on their prospects for the House.

16. I also authored a chapter in Dr. Larry Sabato's *Barack Obama and the New America: The 2012 Election and the Changing Face of Politics*, which discussed the demographic shifts accompanying the 2012 elections. I further authored a chapter in Dr. Sabato's *The Surge: 2014's Big GOP Win and What It Means for the Next Presidential Election*, which discusses demographics and Electoral College shifts. I authored a chapter in Dr. Sabato's *Trumped: The 2016 Election That Broke All The Rules.* I authored a chapter in David Schultz and Rafael Jacob's *Presidential Swing States*, covering Ohio politics and its political subdivisions. Finally, I have been asked to author a chapter for Dr. Sabato's forthcoming book on the 2018 elections.

17. I co-authored the 2014 *Almanac of American Politics*. The Almanac is considered the foundational text for understanding congressional districts and the representatives of those districts, as well as the dynamics in play behind the elections. PBS's Judy Woodruff described the book as "the oxygen of the political world," while NBC's Chuck Todd noted that "[r]eal political junkies get two *Almanacs*: one for the home and one for the office." My focus was researching the history of and writing descriptions for many of the newly-drawn districts.

18. I have spoken on these subjects before audiences from across the political spectrum, including at the Heritage Foundation, the American Enterprise Institute, the CATO Institute, the Bipartisan Policy Center, and the Brookings Institution. In 2012, I was invited to Brussels to speak about American elections to the European External Action Service, which is the European Union's diplomatic corps. I was selected by the United States Embassy in Sweden to discuss the 2016 elections to a series of audiences there, and was selected by the United States Embassy in Spain to fulfil a similar mission this fall. I was invited to present by the United States Embassy in Italy, but was unable to do so because of my teaching schedule.

19. In the winter of 2018, I taught American Politics and the Mass Media at Ohio Wesleyan University. I taught Introduction to American Politics at The Ohio State University for three semesters from Fall of 2018 to Fall of 2019. This semester I am teaching Political Participation and Voting Behavior at The Ohio State University.

20. It is my policy to appear on any major news outlet that invites me, barring scheduling conflicts, and I have appeared on both Fox News and MSNBC to discuss electoral and demographic trends. I have been cited in major news publications, including *The New York Times*, *The Washington Post*, *The Los Angeles Times*, *The Wall Street Journal*, and *USA Today*.

21. I sit on the advisory panel for the "States of Change: Demographics and Democracy" project. This project is sponsored by the Hewlett Foundation and involves three premier think tanks: The Brookings Institution, the Bipartisan Policy Center, and the Center for American Progress. The group takes a detailed look at trends among eligible voters and the overall population, both nationally and in key states, in an attempt to explain the impact of these changes on American politics, and to create population projections, which the Census Bureau abandoned in 1995. In 2018, I authored one of the lead papers for the project: "In the Long Run, We're All Wrong," available at https://bipartisanpolicy.org/wp-content/uploads/2018/04/BPC-Democracy-States-of-Change-Demographics-April-2018.pdf.

22. I previously authored an expert report in *Dickson v. Rucho*, No. 11-CVS-16896 (N.C. Super Ct., Wake County), which involved North Carolina's 2012 General Assembly and Senate maps. Although I was not called to testify, it is my understanding that my expert report was accepted without objection. I also authored an expert report in *Covington v. North Carolina*, Case No. 1:15-CV-00399 (M.D.N.C.), which involved almost identical challenges in a different forum.

23. I authored two expert reports in *NAACP v. McCrory*, No. 1:13CV658 (M.D.N.C.), which involved challenges to multiple changes to North Carolina's voter laws, including the elimination of a law allowing for the counting of ballots cast in the wrong precinct. I was allowed to testify at trial. My testimony was solely on the "effect" prong of the Voting Rights Act claim. I did not examine the issues relating to intent.

24. I authored reports in *NAACP v. Husted*, No. 2:14-cv-404 (S.D. Ohio), and *Ohio Democratic Party v. Husted*, Case 15-cv-01802 (S.D. Ohio), which dealt with challenges to a

variety of Ohio voting laws. I was allowed to testify at trial. The judge in the latter case ultimately refused to consider one opinion, which is not relevant to this report.

25. Although I do not testify in defense of voter identification laws, I served as a trial consultant in *Lee v. Virginia Board of Elections*, No. 3:15-cv-357.

26. I authored an expert report in *Feldman v. Arizona*, No. CV-16-1065-PHX-DLR, which dealt with an attempt to ban the collection of absentee ballots by third parties in Arizona. I had an opinion struck in that case for reasons unrelated to the merits of the opinion; counsel for the state elicited it while I was on the witness stand.

27. I authored expert reports in *A. Philip Randolph Institute v. Smith*, No. 1:18-cv-00357-TSB, *Whitford v. Nichol*, No. 15-cv-421-bbc, and *Common Cause v. Rucho*, NO. 1:16-CV-1026-WO-JEP, which were efficiency gap-based redistricting cases filed in Ohio, Wisconsin and North Carolina.

28. I authored an expert report in *Feldman v. Arizona*, No. CV-16-1065-PHX-DLR, which dealt with an attempt to ban the practice of "ballot harvesting" in Arizona.

I. Dr. Graves' Data Do Not Suggest An Association Between Race And Wait Times in Fulton County, Georgia in 2018.

29. Dr. Graves reports the results of two statistical inquiries. First, he conducts a regression analysis comparing estimated average wait times in Fulton County precincts versus the African American share of registered voters in precincts. He concludes that average wait times in precincts increase as the African American share of registered voters in the precincts increases. Second, he consolidates the data into precincts where a majority of the registered voters are African American and those that are not. He observes that the average of the estimated average wait times is higher in precincts where African Americans constitute a majority of the registered voters.

30. For his first analysis, Dr. Graves utilizes the most common form of regression analysis, often referred to as Ordinary Least Squares regression (OLS). OLS posits that there is some relationship between an output variable **Y**, some predictor variables **X**, some "coefficients" for those predictors **β**, and a random error term **ε**. To express this formally, we write $Y = \beta_0 + \sum_{j=1}^{p} X_j\beta_j + \varepsilon$. *See, e.g.*, Trevor Hastie, Robert Tibshirani, & Jerome Friedman, *The Elements of Statistical Learning*: *Data Mining, Inference & Prediction*, 47 (2d ed. 2017). Since we only have one posited predictor here, we can simplify the expression to $Y= \beta_0 + \beta_1 X + \varepsilon$.

31. What we're really saying here is that there's an underlying "latent process" that produces wait times. Dr. Graves is hypothesizing that wait times in precincts are ultimately a function of the African American share of a precinct plus some random factors (there are specific assumptions about those random factors, but we will set them aside here). In other words, we can

further specify the formula from ¶ 30: [Estimated average wait time in precinct (i)] = [some constant] + [some constant] x [African American share] + [other random factors].

32. One might recognize this as the famous equation for a line from algebra: $y = mx + b$, only with "b" rewritten as β_0 and "m" rewritten as β_1. This is precisely what OLS regression attempts to uncover. The intercept of the line – here, the wait time when the African American share of a precinct is equal to zero – is β_0, while the slope of the line – how much of a change in wait time results from a one-unit increase in African American share of a precinct – is written as β_1.

33. If one looks at the chart on page three of Dr. Graves' report, you can imagine an infinite number of potential lines going through the data. The goal of OLS regression is to identify the one line that *best* fits the data ("best fit" can be defined multiple ways, but here it is defined as the line that minimizes the sum of squared distances from the datapoints to the line). To accomplish this, we (or more typically, a computer program) employ a set of equations known as the "normal" equations. Kevin P. Murphy, *Machine Learning: A Probabilistic Perspective* 222 (2012). These produce the best estimates for the intercept and slope of the lines, which are 16.2 and 4.3 here. This is the basis for Dr. Graves' claims that "[a]s an interpretation, it says that the average wait time for a polling site with 0% Black voters ($x = 0$) is 16.2 minutes ($y = 16.2$), whereas the average wait time for a polling site with 100% Black voters ($x = 1$) is 20.5 minutes ($y = 4.3 + 16.2 = 20.5$). And that between these two extremes, the wait time grows by 0.43 minutes for each increase of 10% in the percent of Black voters." Graves Report at 2. Using the helpfully provided data in Appendix 2 of Dr. Graves' Report, and dropping

observation number 11 (as he suggests), I have reproduced his analysis in the accompanying R Code.

34. If one examines Dr. Graves' chart on page 3, you will see that he reports the r^2 statistic of 0.0151. This statistic can be interpreted as the amount of variance explained by the best fit line. If all of our observation fall on the best-fit line, the r^2 is one; it fits the data perfectly. If the best-fit line doesn't explain anything, the r^2 is close to zero. What we can say from this is that, at best, the African American share of a precinct's registered voter population explains just 1.51 percent of the overall differences (variance) in wait times. There is a lot more at work than race here.

35. Perhaps more importantly, after identifying the best fit line, we often want to be able to perform some sort of *inference*. The data we have are a sample of the precincts in Fulton County, and are a small sample of all the possible outcomes we *could* have had given the randomness of the error term. What we want to know is, assuming for the sake of argument that there was actually no relationship between the African American share of registered voters and wait times, how likely is it that we would we would see an outcome such we saw in 2018. If that probability is particularly low, we might be able to reject this claim. If, however, seeing the sorts of outcomes we saw in 2018 if there were, in fact, zero relationship between race and wait times would not be unusual, we would have no firm basis for rejecting such a claim.

36. The statistic that is typically used for this sort of argument in a regression setting is the p-value. The p-value represents the probability that we would see the data we have if there were no relationship between the predictors and response (here, African American share of registered voters and wait times). Statisticians typically use the following guidelines regarding

interpretation of a p-value: "<.01: very strong evidence against H_0 [the null hypothesis, here, that there is no relationship between the African American share of registered voters and turnout]; .01 - .05: strong evidence against H_0; .05 - .1: weak evidence against H_0; > .1: little or no evidence against H_0." Wasserman, Larry, *All of Statistics: A Concise Course in Statistical Inference*, 157 (2004).

37. After running the regression analysis, the reported p-value is 0.329. Thus, we would not reject the null hypothesis, and therefore would *not* conclude, based upon these data, that there is an association between the African American share of registered voters and wait times in Fulton County, Georgia.

38. Dr. Graves' second test involves splitting the data into two groups: One contains precincts where African Americans constitute a majority of the registered voters, and one where they do not. He computes a weighted average of the wait times in these precincts and concludes that African American majority precincts experienced longer wait times than White majority precincts.

39. Once again, we are confronted with the fact that the data we have are a sample generated from an underlying process. The way to test whether there is, in fact, a difference between these two groups is to perform a weighted t-test. This is a variant on the t-test (one of the earliest and most fundamental statistical tests) which seeks to determine whether there is sufficient evidence from a sample to claim that the averages between two groups are, in fact, different. The weighted variant of this utilizes the weighted means (and variances) following Dr. Graves' (likely correct) decision to weight the observations by the number of registered voters in each precinct.

40. When we perform the weighted t-test, the p-value is 0.623, meaning that it would not be at all abnormal to see results such as these if the true difference between the means of the groups were zero. We would therefore have insufficient evidence, based upon these data, to reject a claim that there was a difference in wait times between majority-White precincts and majority-African American precincts in Fulton County in 2018.

41. Because we do not know whether wait times follow a normal distribution (in fact, since they cannot be negative they almost certainly do not), we can also use a nonparametric test known as the unpaired Wilcoxon test to determine whether there really is a difference between wait times in precincts where registered voters are majority-White and precincts where registered voters are majority-African American.

42. If we perform a Wilcoxon test, the p-value is 0.2266. The data therefore are insufficient to conclude that is any difference between wait times in the median majority-White precinct and the median majority-Black district.

43. Therefore, the evidence from Fulton County, Georgia in 2018 is insufficient to support a conclusion that an increased African-American share of registered voters was associated with greater wait times. Nor is it sufficient to support a conclusion that the average (or median) African American-majority precinct, weighted by population, experienced a longer wait time than the average (or median) White-majority precinct.

Pursuant to 28 U.S.C. § 1746, I declare under penalty of perjury under the laws of the United States that the foregoing statements are true and correct.

This the 15th day of January, 2020.

Sean P. Trende

DEFENDANTS' EX. 4

IN THE UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF GEORGIA
ATLANTA DIVISION

FAIR FIGHT ACTION, INC, *et al.*,

Plaintiffs,

v.

BRAD RAFFENSPERGER, *et al.*,

Defendants.

Civ. Act. No. 18-cv-5391 (SCJ)

Response of Plaintiffs' Expert Stephen C. Graves to Expert Report of Defendants' Expert Sean P. Trende

January 31, 2020

Response to **Expert Report of Sean P. Trende by** Stephen C. Graves

The basic argument in the Trende Expert Report is that with the Fulton County sample data, we cannot make an assertion that the relationship between % African American share and wait time at a polling site is statistically significant, using traditional scientific standards. I have two reactions to the report, which I discuss below.

The first is that in my statement I did not assert that we found from the Fulton County sample a statistically significant relationship between % African American share and wait time at a polling site. Rather the intent of my work was to provide support for the findings reported in "The 2018 Voting Experience: Polling Place Lines", November 2019, available at https://bipartisanpolicy.org/report/the-2018-voting-experience/, by Mathew Weil, Charles Stewart III, Tim Harper, Christopher Thomas. As I state in my report, my main finding is:

"Based on my analysis that I report here, it is my opinion that the general findings in the BPC/MIT report, for the case of Fulton County in Georgia are accurately stated."

So my effort entailed getting the raw data that had been collected as part of the BPC/MIT study for Fulton County, replicating their analysis to compute an estimate of the wait time at each polling site in the sample and then examining the relationship between wait time and the % African American share. In my statement I report the detailed findings, and conclude that what we see from the data and from the analysis is consistent with what is reported in the BPC/MIT report, for the case of Fulton County in Georgia.

My second comment relates to the analysis reported in the Trende Expert Report. The Trende Expert Report provides a set of statistical tests using the Fulton County data. The general finding, as reported in the Trende Expert Report, is that there is a greater than 5% probability that the data we observe in the Figure could have occurred even if there were no relationship between % African American

share and wait time. Based on the different tests conducted, the report finds that this probability is between 20 and 60%. Based on this analysis, the report concludes "...that evidence from Fulton County, Georgia in 2018 is insufficient to support a conclusion that an increased African-American share of registered voters was associated with greater wait times..."

I would raise an objection to this analysis and conclusion.

The first test reported in the Expert Report (paragraph #37) relies on the linear regression model to test two competing hypotheses: a null hypothesis (H_0) that there is no relationship between the African-American share of registered voters and wait times, versus an alternative hypothesis (H_1) that there is a relationship between the African-American share of registered voters and wait times.

For the regression model, these hypotheses can be stated in terms of the value of the slope coefficient:

H_0: $\beta_1=0$

H_1: $\beta_1\neq0$

Critically, the alternative hypothesis includes the possibility that the slope coefficient could be positive or negative; that is, the alternative hypothesis is that wait time might increase or decrease with an increase in the share of Black registered voters.

My objection is with the relevance of the alternative hypothesis. There is a reasonable belief, as well as anecdotal evidence from past elections, that African American voters have longer waits than other voters. For instance, the MIT/BPC report (page 7), citing survey results from the 2018 Cooperative Congressional Election Study (CCES), reports that for 2018:
"African American (11.5 minutes) and Hispanic (11.7 minutes) voters waited longer, on average, than white voters (8.8 minutes)." Indeed, the relevant issue to be tested is whether or not wait times increase with the share of Black voters.

In light of this, I'd propose restating the relevant hypotheses as follows:

Null hypothesis (H_0): there is not a positive relationship between the African-American share of registered voters and wait times, $\beta_1 \leq 0$.

Alternative hypothesis (H_1): there is a positive relationship between the African-American share of registered voters and wait times, $\beta_1 > 0$

Thus, we want to test directly whether wait time increases with the African-American share of registered voters. The implication of this modification in the hypotheses is that one now relies on one-sided tests rather than two-sided tests for determining the p-value and testing the hypotheses. This is a less stringent test but is more relevant for the given question at hand. When one repeats the tests in the Expert Report, one gets a p-value of 0.16, which is half of what is reported in the Expert Report.

Thus, we find that there is a probability of 0.16 of observing the sample results, under the assumption that the null hypothesis is true, namely that there is no relationship between wait time and share of Black voters. Admittedly, this is still not at the "gold standard" of 5% deemed necessary to reject the null hypothesis. But it does imply that we have an 84% confidence level that the true value of the slope coefficient is positive.

The second test (paragraphs #39, 40) and third test (paragraphs #41, 42) are based on splitting the 67 polling sites into two groups, depending on whether a majority of the registered voters at the polling site are African American or not.

For the second test, the Expert Report conducts a weighted t-test to assess whether there is a difference in the wait-time means between the two groups of polling sites. The third test is similar to the second test, but now uses a non-parametric statistical test (referred to as either a Wilcoxan test or a Mann Whitney U test). For both tests, the hypotheses being tested in the Expert Report are effectively:

Null hypothesis (H_0): there is no difference in wait times between the Black majority polling sites and the other polling sites.

Alternative hypothesis (H_1): there is a difference in wait times between the Black majority polling sites and the other polling sites.

I have the same objection with these tests as for the first test, in that the alternative hypothesis includes both when the wait time is either shorter or longer at the Black-majority polling sites compared to the other polling sites. This is a more stringent test than warranted, given that the relevant issue of interest is whether or not Black-majority polling sites have longer wait times than the other polling sites.

Similar to the first test, I'd propose restating the relevant hypotheses as follows:

Null hypothesis (H_0): there is no difference in wait times between the Black majority polling sites and the other polling sites.

Alternative hypothesis (H_1): the wait times at the Black majority polling sites are greater than that at the other polling sites.

Again, the implication of this modification in the hypotheses is that one now relies on one-sided tests rather than two-sided tests for determining the p-value and testing the hypotheses.

When we redo the weighted t-test, we get a smaller p-value: there is a probability of 0.31 of observing the sample results, under the assumption that the null hypothesis is true, namely that there is no difference in wait time between the two groups of polling sites. Again, this is still not at the "gold standard" of 5% deemed necessary to reject the null hypothesis. But it does imply that the alternative hypothesis is more likely than the null hypothesis; using a standard of the preponderance of evidence, we might conclude that this test supports a finding that the wait times at the Black majority polling sites are greater than that at the other polling sites.

When we redo the non-parametric test, we get a p-value of 0.11. Thus, there is a probability of 0.11 of observing the sample results, under the assumption that the null hypothesis is true, namely that there is no difference in wait time between the two groups of polling sites. Again, this is still not at the "gold standard" of 5% deemed necessary to reject the null hypothesis. But it is close to this standard. Whereas we cannot reject the null hypothesis with a beyond-a-reasonable-doubt standard, one might contend that there is clear and convincing evidence to reject

the null hypothesis and accept the alternative, namely that the wait times at the Black majority polling sites are greater than that at the other polling sites.
